Runs OK on an XL. IIRC the copy protection was just to check a single sector
and if it was a valid sector vs a copy protection scheme it would just go
into an endless loop.

I am thinking of getting an old Atari 8-bit. So far I've only been using emulators on the PC. Since I have a 5.25" drive here, is there any way of getting my .ATR files onto diskette so that the Atari can use them.

Thanks, Dunx.

That doesn't help much when an idiot like me leaves it pluged into the
mains and turned on. You try shorting active to earth (240v mains that
is) with your finger. Lucky there was an ELCB fitted to the house.
Else is would minus a finger at best.

No! That's not DOS it's TDLINE.COM which may or may not be installed
depending on the STARTUP.BAT. Also, you can't just PEEK into SpartaDOS
since the addresses for things such as time vary with the DOS version;
you read data at an offset from the address stored in DOSVEC ($0A).

> Russg
>

The Z: handler comes with the RealTime-8 clock cartridge and is not
much use without one. As long as you set the time and date in Startup.bat,
DOS should keep it reasonably well until you reboot assuming you're not
doing a lot of disk i/o since the internal jiffy counter works only in
the deferred vertical blank.

If you install TDLINE.COM, it uses the Atari RTCLOK to attempt to
correct the clock for time lost during i/o and other periods when
interrupts are disabled as well as on a warm start. Unfortunately, for
BASIC programmers, it does not support the time/date XIOs.

The only trouble is that there's no other way to set up things like
focus and convergence. Just be glad you weren't working in the nude
and make accidental contact with something more important than a finger
:-O

I am using APE, so it is dling the tiome from the host pc. Does the jiffy
counter keep the time after the initial dl, or do I have to keep running
apetime to dl it again and again.

Hi all,

For Christmas I received an Atari XE with a bunch of carts, God bless the girlfriend! Anyhoo, this has prompted me to start looking for Atari 8 bit carts (400/800/XL/XE). Below is my TRADE list, which include games for Atari 2600/5200/7800, CV, IV, Vectrex, and Commodore, as well as classic computer mags and books, etc. Hightlights include 2600 Dishaster, Pigs in Space, Tanks but No Tanks, and Tapper. I've also got a slew of more common 2600 carts, just let me know what you're looking for.

Below my TRADE list is the Atari 8bit WANT list.
Let me know if you see any potential trades in here (:

Thanks!
Ryan

Ryan's TRADE list
****
ATARI 2600
03 star ship
11 indy 500
41 surround
Adventures of Tron (White Label)
Artillery Duel/Chuck Norris Superkicks
Barnstorming
Basic Programming (text, PAL)
Boxing (Activision blue label)
Bowling (Sears)
Bump &#65533;n' Jump
California Games (complete)
Carnival
Chase (Sears, box only, glossy book style)
Circus (Sears)
Communist Mutants From Space (box only)
Congo Bongo
Cookie Monster Munch
Cosmic Creeps (standard)
Crackpots
Crossbow
Dare Diver (Sears)
Decathalon, the Activision
Dishaster
Donkey Kong Jr. (Atari)

Enduro (Activision blue label)
Fast Eddie
Fire Fighter
Fire Fly
Football (M-Network white label)
Ghostbusters
Ghost Manor/Spike's Peak
Gorf
Gunslinger
Infiltrate (blue label)
Journey Escape (new in box)
Lock &#65533;n' Chase (White label printed over blue label, funky!)
M.A.D. (fancy label)
M.A.S.H.
Math (Sears)
Midnight Magic
Millipede
Name this Game (fancy label)
Oink!
Omega Race

14. Airball - has anybody won this game?

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-01 17:27:53 UTC
From: Dallas Browning <browning@aros.net>
Message-ID: <92qea1$1k55$1@news.aros.net>
Source record: 39837

Okay, I'm sure somebody out there has actually somehow won the game with only the 4 measley lives that you are given. But I don't know how you did it! I wish there was someway to "continue" or something. But I guess "cheats" are fairly rare with atari cartridges, eh? I can easily get the spellbook, the cross, the buddha (though I don't know how to get back without dying), and I've found the can of beans before, but that's it. I'm partially addicted (I actually hadn't played for about 7 years, and then I just found my old XE system, so I'm starting up my addiction again), so I'm sure I'll figure it out, but if anybody has any tips, please send them my way!

Thanks,

Dallas

15. Re: Spartados time from basic

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-01 18:11:18 UTC

```
OK.
So the 'Z:' handler only works if you have the RT8.
OK. SpartaDOS still can display the time/date without the RT8.
From the SpartaDOS manual, a BASIC program to read time and date.
10 CMTAB=PEEK(10)+PEEK(11)*256
20 FOR T=13 TO 18
30 ? PEEK(CMTAB+T)
40 NEXT T
above will display:
day, month, year, hours, minutes, seconds.
The locations are for SpartaDOS and don't require the RT8.
You have to write a BASIC program to POKE COMTAB+13 to 18 if
you want to set the time/date.
You can use TDLINE to see the results of your POKEs.
The main usefulness is that files SAVEd will get the right time/date stamp.
If you don't set the time and date, they will always be 3:59PM 1/1/84 on
bootup. You could use the TIME command of SpDOS to put up
the display (never tried it, always used TDLINE). Then you can use
the SET command (SET mm/dd/yy hh/mm/ss) to set the time/date and
then read from the locations above in BASIC.
Russg
Still trying
```

I found a schematic from a web site from Emmanuel Fernandes of Belgium at
http://users.swing.be/atari/joystick.html
He plans on updating the page with a new version of the device with the
following characteristics:

- less electronics, a much simpler design,
- support for classic Atari joystick, the 2-buttons Atari 7800 stick and
the Sega Mega Drive Joypad.

If he can't make the device for me I would gladly pay you to try!

20. BBXFER 1.8 Patch #1 available

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-01 19:56:21 UTC
From: Dan Vernon <danver@halcyon.com>
Message-ID: <92qn5k$s5m$1@brokaw.wa.com>
Source record: 39843

BBXFER 1.8 Patch #1 is available at:
http://www.halcyon.com/danver/atari

Note: this is NOT a redistribution of BBXFER. You must have an original BBXFER 1.8 binary to apply this patch to. BBXFER is copyrighted by Computer Software Services (http://www.nleaudio.com/css). This patch is just in place temporarily until the fixes can be merged into CSS's source code.

revision history:

12-20-2000
The "truncation bug" has been fixed. This bug occurs when copying large files from the Atari to the IBM-PC disk. The files are truncated somewhere around 18k.

12-31-2000
The dates now are no longer being trashed when going from the Atari to IBM-PC disk. This was a Y2K problem, so it only was an issue with recent files.

21. Re: Rick Cortese! Need your help

I found the schematics from Emmanuel Fernandes at
http://users.swing.be/atari/joystick.html
He sas he will be updating the page with a new version of
the device with the following characteristics:

- less electronics, a much simpler design,
- support for classic Atari joystick, the 2-buttons Atari 7800 stick and
the Sega Mega Drive Joypad.

If he can't make the device for me I would gladly pay you to give it a try!
For now study the old schematics.

Hi there. On Dec 29th you hinted that you might make the program you wrote for TV convergence available. I was wondering if this was still possible? I sure could use it. Or at least some sample basic code that would show me how to do it myself.

Jim.

Well, it took a little but...
I've put the three versions I've made so far (well, there have been
some intermediate versions, but those were development only...
strictly speaking, the last is also development only, I need
some feedback to finish it)
As I was saying, I've put those files at my web page. Check

http://www.geocities.com/Hollywood/2645/A8/

The files are the following:

TV_CALIB.ARC.ZIP: contains all three ATARI BASIC program
files. It's really an .ARC file only,
remove the .ZIP extension when saving

TV.LST.TXT: the oldest version, in LISTed ATARI BASIC
format. Remove the .TXT extension when saving,
too. Don't worry about the seemingly strange
characters in one of the program lines, they
are just supposed to be INVERSE VIDEO characters.

TV2.LST.TXT: a slightly modified version of the former.

MITV.LST.TXT: this is just in the form of an add-on "patch".
You must ENTER it after having loaded TV2. Then,
just to see the added (unfinished) test screen,
don't RUN the program; use GOTO 900 instead.
Using RUN will just give you the "standard"
options from the preiosu version. Feedback
needed to finish this one!

Thanks JT. The T.V. is now converged and working much better then before. It is a 52 inch Hitachi and I had my speakers to close to the damn thing. (still do) The magnetics from the permanent magnets are gradually magnetizing the yokes on the three picture tubes. I will have to degauss the damn thing soon and the atari can't be programmed to do that.

The program is great. I threw a paper copy of it into the same slot in the TV I keep the convergence chart for the controls.

Again thanks a lot. If you want to respond to me take the internet out of my email address. It should be "yushi@look.ca"

Once time and date are set in Sparta, the jiffy counter will keep it
going but, without TDLINE installed, it's not Reset-proof and it will
lose time everytime maskable interrupts are disabled (disk i/o, etc.).

I don't use APE but I assume it's run on the Atari. If so, you could
use AUTOBAT to re-run it on Reset.

Okay it's done for now, the URL is
http://chainsaw1661.tripod.com/crush.htm

For the moment I have a page devoted to Epyx- Crush,Crumble and Chomp!
There's also a link to download a copy of the diskey disk editor manual.
Not much but it's a beginning. Maybe if I get enough material together
I'll put together a real website, although I don't know where I'll find
the time. I'll keep scanning and make this Umax earn it's keep.

If you don't have the proper equipment, a 220V/110V transformer
or a soldering gun may do. Just pass them in front of the screen
as if you were "combing" it (always in the same direction).
The coils generate an almost uniform magnetic field in the immediate
vecinity of the center, and that's what's needed to degauss
a screen (not sure if it will work with such a big one, but...)

I just remembered when one of my cousins (don't know which of
them for sure) left a dismantled speaker lying on top of their
TV set, after that they didn't know why their TV screen was
half-green and half-purple...

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

1. Tic Tac Toe 3D - there is really no chance to win...
2. Tower Toppler - a prototype, very expensive and very buggy on XL,
completely crashes after level 2 (better try the VCS 7800 version!)
3. ...Maze - seems to work only on a real Atari 800, did not work with
XL atari, did also not work with any translator disk/translator
cartridge/old OS installed on an XL computer
4. Battlezone - the XEGS cart is so booaaring (Lynx 2000 version is
great, but even the normal version is much much better!)
5. Hardball (Baseball) - I am german, thus I do not know the baseball
rules...
6. Football - I also do not know the rules nor how to play this game...
7. -10. sorry out of memory at the moment...
-Andreas

Well,
a good friend of mine also has some problems with Airball, but not
considering lives. the manual says 150 different rooms to explore - and
the ST version has 150 rooms. but with the XL version he yet discovered
more than 300 different rooms, many items, but still he did not reach
the end of this game... -Andreas

Hi there !
a few weeks ago someone (Ken Siders?) announced the first A8 TCP/IP
software (beta version or so). Unfortunately I lost the URL. Can someone
tell me the proper URL again ?? (I found Ken siders homepage, but this
one did not cover the TCP/IP software for the A8). -Andreas

On Mon, 25 Dec 2000 05:36:58 GMT I seem to recall Dan Ritter as saying:

|Does anyone have that old simulation Scram? It was of a nuclear reactor.
|
|
|
Damn. I remember that game. I was about 10 at the time, so my favorite
thing to do was to cause a meltdown in the reactor. Whee!

56. Suggestions for a MyDOS update...

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-03 18:52:24 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3A5374E8.49FE4026@mail.uni-mainz.de>
Source record: 39778

Hello folks,
since MyDOS (and DOS 2 compatibles) is (are) my favourite DOS, I always discovered the newest version. Now, MyDOS 4.53 is very nice, but could still have a few updates - in my opinion:

1) The "I" command (format disk):
This subject should cover the most standard disk formats, like 90k, 130k, 180k, 360k, 720k and 1440k. You should be able to choose your format directly rather than first doing a setup (via the "O" command) and then choosing the proper density (single or double via the "P" command). Just pressing the "I" key and then choosing a proper format should be enough. Thus, the I command should present a menu, where we could choose the format directly...

2) The "O" command (setup):
there are two main jobs of this command: a) pressing just return to setup the DOS/DUP or b) pressing a number from 1-9 to setup a drive or harddisk.
Both jobs should stay intact, but there should be no need to setup a drive, only a harddisk, as long as the new "I" command is present. On with the drive setup, the prompt first asks to "Remove drive" which is rather nonsense in my eyes (this question should be removed instead!). I do not know anyone who ever typed "Y"es here to remove a floppy drive. And most harddisk interfaces I know (Black Box, german IDE interface, polish IDE interface)also come with their own OS, where you can type a certain key combination to change or remove harddisk partitions. So the "Remove drive" question is not nescessary here...

"Is drive configureable?" is the next question and since we use/include a floppy drive setup with option "I" this question is not nescessary of course. "High capacity drive?" since we only setup harddisk here, this is obvious (and still not nescessary to ask for). "Is drive double-sided" - the answer may be already given within the "I" command (if you choose 360k, 720k or 1440k there, your drive is/should be double-sided). So another unnescessary question. "Tracks per side" is also unnescessary, since option "I" uses the standard formats and densities with 40 or 80 tracks (720k and 1440k have 80 tracks, all other formats have 40 tracks). "Step rate?" a completely silly question, since MyDOS does not tell you the step rate of your drive (you may guess it, but if you guess wrong MyDOS hangs up and merely recovers with a coldstart). No other DOS 2 compatible DOS I know makes use of the step rate... So finally, once there is a new "I" command installed, most of the "O" commands are unnescessary in my eyes.

There are however drives that cannot detect the density (single or double), the sides (1 or 2) or the tracks (40 or 80) automatically. But MyDOS always configured properly with my "stupid" XF551 drive and should do so with other "stupid" drives. And having non-standard densities, like SS/SD with 80 tracks or DS/ED 40 tracks or something like that does not make much sense in my eyes, thus the six standard densities (90k, 130k, 180k, 360k, 720k, 1440k) plus harddisk support (up to 16MB as usual) should be enough...

3) the "P" command (density)
This command was introduced to a) set the density properly, even with "stupid" drives, but MyDOS always checks and discovers the density right. Another reason was b) to set a certain density for formatting (option "I") a new disk, which would not be nescessary anymore if a new and improved I command gets programmed.

These are all my suggestions for now. As you could see a few changes in the I command also take effect in the O and P commands. By the way, anyone ever used the last two MyDOS commands to set write verify (on or off) or set the ramdisk drive (8 or 9) ?? I always use write verification off (and most other users I know do also) and drive 8 for ramdisk (since most programs use ramdisk as drive 8). greetings - Andreas

P.S.: Maybe a good programmer (not me!) is willing to do such a MyDOS update...
- further suggestions or comments possibble...

57. graphical interface?

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-03 19:59:58 UTC
From: pjsmith@netins.net
Message-ID: <slrn95715u.82v.pjsmith@worf.netins.net>
Source record: 39779

No, I am not asking if there is one available (that's been done to death already). :-)

I am a recently "reborn Atarian", having reacquired much of my old Atari 8bit hardware and software and was thinking of writing some kind of graphical interface/environment. for it. I was merely wondering if there would be any demand for such a thing. Anything I would produce will be 100% free, of course. If there is some interest, it would keep me motivated to work on it. :-)

I'm not talking about something full blown like GEOS for the Commodore, but initially a relatively simple graphical application environment, running in graphics 8 mode (thus limited to two colors) capable of running some simple apps. I don't envision it running a word processor or spreadsheet.

I have done some initial research and coding. I've gotten an ST mouse to work (using Multimouse) and done some fiddling around with machine language. Currently, I am using ATASM V0.94 on my PC and using SIO2PC to transfer the program to my 130XE.

Yes, I am aware of other GUIs out there (DCS, Diamond, GOS, etc...) but just thought I would try my hand at one for fun.

Thoughts, suggestions, flames?

Thanks,

Phil

I would if I knew of any, although there were so many progs made for
the Atari8bit I could spend a lifetime studying them. I think there are
a lot of lost progs out there that were produced but lost popularity
and then were forgotten (i.e. Diskey Disk Editor, Educational Master
System, ETC.) These are the ones that really turn me on! Imagine my
excitement when I opened a box of atari hardware I bought at auction
and found a Parrot Digital Sound digitizer with software disks! It came
with a sample of Michael Jackson singing 'Beat IT'. When I found that I
hit the floor laughing! If anybody has any ultra rare stuff like that
pipe up! We need your ATR's!

I threw up a home page with documentation on some Epyx, Avalon Hill and Microprose games. It's still under development in my spare time and will eventually be a considerable resource, especially after I find a new place for it than Tripod. If anyone has any documentation they'd like to see posted there, please send it zipped to me at chainsaw11@my-deja.com
The link for the homepage is

You are correct; this could be better.

>2) The "O" command (setup):
(snip)
> - the answer may be already given within the "I" command; most of
> the "O" commands are unnescessary in my eyes.

"Remove?" is superfluous, but sometimes I need to configure the sides or density of the very stupid non-sensing Percoms without wanting to format a disk.

That step rate business is totally confusing because I don't know the milliseconds of mine and an SIO "N" call shed no light and I saw another document which had the fast to slow 1-2-3 choices exactly reversed from the MyDOS docs? I usually pick "2" and hope for the best.

> but MyDOS always checks and discovers the density right.

"Always" is a long time! I often must toggle density just to get a directory listing and would prefer not to do it with a format command...

You should check Mirko's before you invest a lot of time on it... He uses Gr 8
and some proportional fonts and the ST mouse.

Might even sign on to assist with some of the coding.

The Windows sound recorder is no good, because it only allows you
to record up to 60 seconds of audio. You need a lot more, sometimes
up to 30 minutes or more. If you have a Soundblaster, you
probably also have Wave studio. That will do just fine. There are
probably other programs that will work too.
wav2cas and cas2wav can be found on my home page:
http://home.planet.nl/~ernest since I wrote that stuff.
Converting it to .atr files is the hard part. Emulators
do not currently support the .cas format. Probably because
most of the interesting stuff is available in .atr format anyway.
One of my goals was to recover damaged tapes, or stuff

that you saved onto tape yourself. But it works on all tapes
of course.
Keep those XL's/XE's buzzing.

I don't know whats going on with tripod, I had to enter it three times
before I could get through. I'll probably wind up going to a virtual
host after I get most of my archive scanned and ready.

Yes I have a web site! Ron forgot to tell (he wrote a weightfull part of my system).

Hi, I am Mirko Sobe and I wrote a graphical user interface for the Atari XLE computer. You can visit my website at www.atarixle.de . You can download the system for free, but only the german version is the actual version. The english version wiull follow (when the "FASTTEXT"-description is displayed in the download area).

Mirko

PS: thank you Ron, for advetising :-)

You have contacted me privately in e-mail. I have the rights to
distribute the product but not the rights to sell the Source Code,ect.
These are owned by Mike Hohman of FTe and I am sure he will not
relinquish any of these at this time.

The only way I came into these rights was supporting him when he first
got started.
I know where he is, has relatives across the valley from me, but respect
his wishes not to be bothered with trivial items. He as I reads this
base from time to time not every day, nor do I but keeps up on what is
going on. I have 2 e-mail address for him one still works so I know he
is still around.

From my conversations with Mike, Sparta Dos X is his baby, will not be
sold ect.

Other options may be up for sale.. Post a message to him here and if you
are lucky he will respond privately.

bob

I just noticed going through my old carts, I have one Star Raider cart
and one Star Raiders. Both play the same as I can tell, labels are in
extremely good condition. Is one maybe an earlier release?
Interesting....

On my researches about Epyx, I think I might discover one or another
such thing...
At the moment I'm trying to find out all about 'Moreta - Dragonlady Of
Pern', the lost sequel to 'Dragonriders Of Pern'... whether it was
planned for the Atari 800 or not, I don't know yet...

Greetings,
Manuel

Star Raider is the earlier release.

There's not as many around as Star Raiders but it's not that uncommon either.

John,

I totally agree with you on this copyright issue... I wouldn't honor a copyright or anything else for that matter related belonging to ICD or Mike H. I actually think that ICD (read: Tom Harker) is worse though, since he still after all these years puts up a front of being in business (www.icd.com) but just takes money & never ships. I'm still waiting for my Link-2 to be delivered... I think its going on 3 years now. At least Mike just took the money and disappeared... you can't say that about Harker though.

I've been looking for an old version of spartados for a while... I think 2.3? at least its 2 something. Anyhow I've read about a program called LOGOMENU.SYS that lets you use sparta as a nifty binary loader. You wouldn't happen to have a copy of this laying around by any chance? It might have come with the sparta construction set.

Also I pretty much use sparta 3.2g (this is a shareware version no?)... it works great as far as I can tell! Never had a problem so far. Is there another version you recommend? I know that Video61 sells the stupid cart version that you have to yank out. I'd never buy that.

I bought my US Doubler off of ebay. It was included with a box of misc. Atari stuff... magazines & programs. No DOS of any kind was included, just the chip & instructions. Paid around $20 for the lot.

Sorry, but I have no idea why are you so upset about people buying new or used copies of the US Doubler upgrade with no DOS???

Several shareware versions of MyDOS and Sparta can be downloaded from the Umich ftp archive for free and work just fine with the upgrade.

This is an interesting discussion.
It is a little hard to keep track.
BBS Pro is Lance's. ICD stuff is FTE's.
It is news to me that 3.3c is also Lance's. I don't have it and it
is most compatible for use with BBS Pro.
3.2g was shareware, Expected to register if you used it, for $20, I think.
I never registered or used it, other that to look at it. My 3.2d,
purchased,
suited me fine. Then I got a SpX cart. I have to disable the high
speed stuff with SpX because my real drives couldn't hack it (Indus,
USD 1050s), and kept trashing real disks. I still use 3.2d. And I use
3.33a for emulators, don't know what the status of that one is.
I think Tom Hunt made the 3.3a.
I do remember that FTe seemed to sorta expect people that continued
to use SpartaDOS to register the 3.2g one, even if they were still
using 3.2d. I'm not sure what improvements/fixes 3.2g had over 3.2d.
Great DOS, my favorite, in any flavor.

the stupid cart version that you yank out(i do not yank anything out, i am a adult who has found out that yanking out something can cause damage) is not a FTE product.
this version of sparta-dos 3.3c was contracted for thru FTE, and upon reciept of the source code with comments, it was paid for. it is not freeware/shareware, or PD. this was written for the PRO BBS SYSTEM, and not for FTE use. i own PRO, anyone who illegaly copies this, that means you cannot copy a cartridge because it is not media that fails easy, and or distributes this can face legal action.
you are free to use dos 2.5,or any other dos that is in the PD.
this version of sparta dos is pretty solid with little or no discernible bugs, that is what might make it so attractive.
your gripe is with FTE, not me.

>(eg, D2) but can't get past there.

Pretty broad question... that DOS menu probably has a command list which
includes "L"oad a binary file for .EXE or .COM applications. You will need to
reboot the XFormer with Basic enabled before you can LOAD, SAVE, etc any of the
many basic programs. Try here for some helpful instructions:
http://members.xoom.com/Pairman/Ref.html
You get better info from specific questions rather than a globas request. Which
version of XFormer?

Source record: 39666

Hi Y'all -

Last weekend when I...

cleaned out the basement;
found my old 8-bit stuff;
searched on the net;
found this group;
discovered emulators;
surfed all around Atari sites;

I was impressed by all the good work you folks are doing. Particularly the posting/archiving of the old magazines and such.

Looking around at what's available, I haven't seen the "DEMOPAC" series yet. These how-to documents were published by Atari Consumer Product Service - Product Support Group. Is anyone here currently working on posting these?

If not, does anyone think they'd be valuable to the A8 community? The eleven issues I still have are all dated between 05/82 and 12/83. Here're the subjects:

01 - 09/82 Strings and Formatting
02 - 10/83 Data File Processing
03 - 05/82 Programming Examples
04 - 06/82 Atari Color Graphics
05 - 06/82 Advanced Graphics
06 - 06/82 Advanced System Features
07 - 09/82 Some Special Features
08 - 05/83 Software and Hardware Timers
09 - 11/83 Atari Logo InfoPac
10 - 12/83 Atari Logo PrinterPac
11 - 11/83 Atari Logo Programming Examples

Each one's about 10 to 20 pages, and features around 5 to 8 topics. Anyway, if they're already out there, let me know. If not, what do y'all think about putting them up on a site? Thanks.

- Ken

Lance,

Sorry if I offended you Lance, I could easily be mistaken, but this is what you wrote several months ago in c.s.a.8:

"here is a list of all the new carts we have released n the last 2 years,all carts come in a box,with documentation,except sparta dos3.3c,we are currently working on doc's,all carts run directly from the cart port except the 3 utility carts,they are installed,then taken out,we currently are working on more titles,and we will post them when we are able to,all titles carry a $19.95 a peice price,
mydos xl/xe only,this is the newest version,and has some improvements
sparta dos 3.3c xl/xe only,this is the most solid sparta yet
translator cart xl/xe only,now you can have fast boot of your incompatible 400/800 programs,no more wait time for translator disk boot up,this aso works on many carts"

The key words that I read above are "installed, then taken out", hence the "yanking" that I refered too. Maybe yanking is too strong of a term, but any way you like to describe it, it is a hack and not something I'm interested in purchasing. I have read several posts from people who ordered the cart and were very disappointed with it. I do apologize for assuming the blame of the design was yours. If you do come out with (or manage to get licensed for) a new disk-based spartados or a new cart version of Sparta that works similarly to SpartaDosX I would definately be interested in buying. Especially if it came with documentation. I'm sorry for being so negative, I really appreciate all the work you've done to make the new cart games available, and keeping your Atari Sales business running. I just am not happy with the current choices available at the moment to purchase a valid copy of SpartaDos.

alt.atari.2600,alt.atari.2600.vcs,alt.atari.2600vcs,alt.games.video.classic,comp.sys.atari.8bit,rec.games.video.classic

I am trying to finish off my collection and only need a few things. I want the few things bad enough to pay good money, or to trade good stuff for. Here is a list of things I want followed by how much money I will pay for them, or what I will trade:

Wanted: MULE disk complete pay $15 or trade for MY 800xl Pitfall II cart only

Alley Cat disk complete pay $40 or trade for MY Hypnotic Lands cart with small leaflet/manual

Jet Set Willy disk complete pay $15 or trade for MY 800xl Pitfall II cart only

Ultima 2,3, and 4 *ALL 3 boxed* for Atari 8-bit TRADE FOR MY Atari 2600 Crazy Climber,2600 Pengo w/manual, and 2600 Tapper with no spotting on label PLUS Pitfall II AND Hypnotic Lands 8-bit carts

Also needed carts: Boulderdash, Pastfinder, Pharoah's Curse, Topper, Spy Hunter, Up 'N Down (will pay $35 a piece if labels are nice, no spotting or extremely minimal spotting allowed)

Disk games needed COMPLETE ONLY: Mousetrap, Montezuma's Revenge, Neptunes Daughter, Ixion, Tail of Beta Lyrae, Return of Heracles, Telengard, Phantasie, Warrior of Ras 1,2,3, or 4 (Dunzhin, Kaiv, Wylde,or Ziggurat)

ANyone out there with a big Atari 800 xl collection anywhere in the world who may want to trade please e-mail me. I have planty of stuff from every system imaginable that I may just let go of to complete my Atari 800 xl collection. Thanks! -Satcom2

Not being a smart ass or anything but I had Ultima II, III, IV (all complete in box, even had the Ank(sp)) last year and I Ebay'd them, Got over $250 out of them as a package deal, they are commanding a high price with Ultima collectors.

Sounds good, It was my understanding that the 2600 version had an
overlay for the touchpad controller, I'm not sure if the touchpad
worked with the 800 version of the game. I tried it and nothing
happened.

These are definitely a desirable item. I haven't seen any for a long
time. If you want to do the scanning and email me your zipped jpg's I
can integrate them into the homepage I've been putting together. Or
heck make your own site. These would definitely be worth any trouble.

I would second that sentiment about pulling a cartridge from a powered-up computer. It is totally unacceptable to me because it plain seems wrong, additionally there is no way to do it on an Atari 800 or 400 because of the protective cartidge port cover. I was really amazed that such a questionable product would even sell at all.

I like the idea of a cartridge based DOS. It would provide a lightning-fast bootup, and awesome convenience when working with a single-floppy-based system. It would allow great flexibility with double-floppy-based systems. I was hoping that having the OS on ROM would free up RAM too, but maybe that is not the technically correct way to look at it.

Lastly although there is some acrimony going on here, I would urge people to make a positive effort to respect Lance Ringquist's copyrights, since these are current offerings from his company.

That is an interesting trio of software publishers to focus on. Avalon Hill I recall was especially notable. They had the most awesome packaging, with righteous big solid boxes, as opposed to the pitiful cartons so many others had. You could take an Avalon Hill product and put it proudly on your bookshelf.

However the Avalon Hill programs themselves were a little iffy, at least the ones I had. I had Guns of Fort Defiance, which was a BASIC program that didn't work very well. I had TGIF which was a "party game." TGIF was actually okay, with a lot of variety.

Well,
Sparta DOS 3.2g appeared with a Shareware notice on an ABBUC magazine.
So yes, its shareware. You do not have problems with 3.2g ?? Try to load
the DUP menu from 3.2f or the Read.COM or Diskrx.COM, all these (and
many more) do not work with version 3.2g !!! You get an error like "need
sparta 3.2" or other errors and bugs. I do not like sparta very much,
but I absolutely hate applications and external commands which need a
special version of Sparta... (its like having a DOS 2 tool which merely
works under DOS 2.5). -Andreas

Well,
pulling a cart out of a powered-on computer is really something I do not
like very much. But there is no problem with an Atari 400 or 800, since
the Sparta Dos cart 3.3c which Lance is selling is XL/XE only...
-Andreas

116. The ten worst A8 games...

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-05 15:33:07 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>

Well,
we have had this post several times, just the other way around (tell me
your favorite A8 games). So why not ask for the worst ?? Ok, what are:

1) your ten worst A8 GAME carts ??

2) your ten worst A8 GAME tapes ??

3) your ten worst A8 GAME disks ??

4) your ten worst A8 GAME sounds ??

5) your ten worst A8 applications or tools ??
(any format: disk, tape, cart)

greetings - Andreas.

P.S: This is just for fun !!!

daniel,
the reason that we did sparta that way was because at the time we had no other cartridges available. we sure would have loved to have a pass thru cart, but at that time, and maybe this time, it is not financially feasible. but we now at least have a bigger cart(memory) and are looking at doing something with them so that you do not have to pull the cart out.
the cart port is turned off once the computer has been turned on, and it will not harm your machine. i use these carts daily, and have never hurt my machines, and i have 4 8-bits setup, and i use them on all of my machines.
even with the bigger carts we still might not be able to make it available to 400/800 users, but we will sure do our best for you.
the reason why we did it in the first place was for users who just did not want to wait for slow boot up times, and were heavy users of dos, like me, i cannot stand to wait when there is work to be done. we have sold quite a few of these. the main problem we have ran into is people who think that this is sparta-dos-x. and there only have been a few of these.
thanks for the post,
lance

Wow and to think I almost tossed these! ;) I'll try to scan what I have. It is easier than HTML assuming my OCR doesn't work. Give me a few days.

Just for a historical note on how I got these. I remember calling the Atari Consumer help line (or something like that), trying to get help after blowing the internals out of my modem. One of the nice people there asked me if I needed help and offered all these "Tutorials/Tech. Docs." I asked for a couple on graphics and something else.. can't recall exactly. Anyway, they mailed them to me free of charge. They really look like they are the photocopy of a photocopy of a photocopy.. etc. But it was good info, most of it I already had at the time I think. (1983-1984 time frame)

Andreas Magenheimer wrote:

>1) The "I" command (format disk):
This subject should cover the most standard disk formats, like 90k,
130k, 180k, 360k, 720k and 1440k. .<

You left out 1.2 meg for 5 1/4" drives, 180K applies to single sided/dbl dens and dbl sided/single dens. Yes, there are a lot of old drive formats that don't need direct support.

>2) The "O" command (setup):<

Actually, Remove Drive is needed...I use 4 drives normally(2 @360K,1 @~1.2 meg, and 1 1050), but when I get ready to write disks and DOS for others, I need to remove all but D1: because they won't have these drives, and DOS will boot faster if it doesn't have to look for all 4.

> "Step rate?" a completely silly question, ...<

Step Rate can be set to 0 (see the manual, 8" same for 3.5") for most modern drives made in the last 10 years. It is needed for older drives that are too slow. And this setting can affect how quickly a disk will boot. But so does the drive/interface the disk was formatted on. Mydos is probably not locking up..its just waiting for the stupid drive to return an ack, which it may never do. If the 810/1050/rana/indus/percom/et all mechanisms could be replaced, this command could be deleted.

>3) the "P" command (density)
This command was introduced to a) set the density properly, even with
"stupid" drives...<

This is still needed..format is not always needed. Old drives and difficult disks need to have MYDOS force the density. Even though MYDOS may change density, the drive may not(the XF551 for example).

>By the way, anyone ever used the last two MyDOS commands to set write
verify (on or
off) ...<

I leave write verify OFF unless I am using an 810 or sending someone a disk that uses an 810.

>... set the ramdisk drive (8 or 9) ?? <

My ramdisk is usually set for 8. But, I do set it for 9 sometimes. There is a lot of older software that will not let you enter a drive value greater than 4-so I set the ramdisk for 4 when needed(I made a MYDOS boot disk setup this way.) Rarely, I use a program that needs everything to be on drive 1,

so I turn off my drives, and set the ramdisk to 1. And there are times when I set MYDOS for a D8: ramdisk, and Omniview for a D4: ramdisk.

With 512 byte support, Mydos can handle 32 megs. Special software that handles clusters caould make for large drives in the gig range.

Yeah thats for sure! It seems to me that Avalon Hill released the Atari
series of computer games at a time when most people were still playing
board games. I guess to make the transition easier they retained the
large thick boxes, which makes them still desirable today. The programs
were not what I would call top quality though, most played like
something you would type in basic out of a CLOAD magazine. I have Moon
Patrol, Bomber Attack, Tank Arcade, Planet Miners and Flying Ace. One
of the really appealing things about Avalon Hill is that their tape
releases contained the program in about 6 different versions for
everything from Atari to TRS-80 to PET and so on. I'll be working on
archiving the box covers and instructions and eventually a .cas file or
.mp3 of the tapes themselves. I only have a couple of Microprose,
Crusade in Europe and Nato Commander, but I'll eventually get those up
as well.

Do we have to come up with 50 different ones? Ahaha!

Someone will probably come back and say how much they love Alien
Garden, but I think it is terrible.

Guns of Fort Defiance was fairly crappy (but had great manuals and
box).

I thought Journey to the Planets was horrible, but some people are
totally enamored with it. People erect websites to JttP.

My two cents worth:
I find the 64 file limit as the greatest restriction, and if MyDos would go to 32 or 48 meg, it would be even worse. Instead of making MyDos bigger to handle lots of formatting and other options, I'd go with a few short .com files that would overlay Dup.Sys, then reload the menu when exited. A little like that "other" Dos that Atari people like. :-)

Dan,

It just goes to show you never know who's gonna screw ya. Tom Harker and ICD were one of the most reputable dealers in their day. Great and innovative products for Atari 8, Atari ST, even dabbled in Amiga and PC. Customer service was always good to the best of my knowledge. I even met Tom several times and he always seemed like a great guy.

Now look at all the people he has ripped off for products like your Link-2 and more notably all the Jaguar owners who paid for Catboxes in advance.

Similar thing with Mike Hohman. He and I were good friends. Visited him in CA. several times. Even spent a night pulling zillions of SX-Express packages out of Atari's dumpster to get the SIO cords out so he could use them in his projects. Lent him several rare Atari prototypes to tinker with. Sent him money to pick up a prototype monitor for me. I knew he had no cash but trusted him just the same.

Looking back I can see that he wasn't really serious about what he was doing. He was a wannabe engineer with grand plans.

Anyway, I've strayed far enough off-topic here.

Contact me in email at: jhardie@pipeline.com and I'll get that 2.3 stuff to you.

John

Just thought of something else I haven't been able to find. It was a two-part demo. It had an awesome robot that looked like it was walking toward you with some funky beat, and the second part was a flying spaceship that zipped towards the right side of your screen. Please let me know the name and where I can find it.

That was the "Atari CES 85" demo, if I'm correct. Maybe somebody else knows
a place on the 'net where you can find it. Otherwise, send me an email and
I can email it back to you.

>While on the subject of the R-TIME8 I tryed the "fixed" TDLINE.COM but
>I
>still get the wrong day using my SPARTADOS-X CART

Okay ... I want you to go to the archives and find a program called "Bedit.com"
by Bill Aycock I believe.

Next, pull a copy of TD.COM from your SDX cart (type car:td.com >>td.com)

Now, using Bedit, edit your TD.COM. (R) reads the file into Bedit.

Go to byte 426 using the goto command (G). This is the start of a 12 byte
offset table. Increment the 12 bytes by 1.

e.g 00, 03, 03, 06, 01 becomes 01, 04, 04, 07, 02
the command is, =01 or what ever the required byte is.

Write the file to a disk (W) a name other than TD.COM (TDD.COM) .. and load it
insted of TD.COM when you next boot SDX ... you're day of the week is now
correct.

The existing 12 bytes will be:
00 03 03 06 01 04
06 02 05 00 03 05
followed by the days of the week first letter table
SSMTWTF

Hope this helps

>2,3,4,5,6,7,8) ?? What should these subjects include or deal with ???
>-Andreas

Hi Andreas,

Several months ago I started a massive cleanout of old and obsolete stuff in the FAQ. The whole list of "all" 8-bit Atari web sites, for example. And compacted a bunch of sections into the "welcome" faq so the main faq and the welcome faq don't duplicate each other any more.

I hope to put more significant time into the faq this winter. That would include fixing up the numbering scheme!

If you really want to see the old sections, there are plenty of old copies of the FAQ on the web, why people put local copies on their servers rather than linking to a "live" copy like at www.faqs.org is beyond me.

Thanks for asking,

-Michael

but -
the stupidity of the following post has forced
me to break my silence. Please forgive my waste
of bandwidth here...

Lance,
Please,
Just shut up.
Stop talking about pirates and Jewish lawyers.
Nobody illegally distributes anything on
the 8bit. If you don't shut up, Ill be forced
to send you a linux box in the mail that will
cost me less to build than your stupid
"sparta dos 3.3c leagaly paid for" (just trying
to put things in perspective here)

Anyway -
Back to enjoying the rest of the HOBBYIST posts
in this group...

A company called Sierra Services released annual indexes of
Atari-related articles that ran in Antic, Analog, and Compute!
magazines. I have the data files from 1983, 84, 86, and 87.
Does anyone happen to have the 1985 index? Or know if they
make indexes for before 83 or after 87?

Thanks
Kevin

The name sounds familiar, but I'm afraid I don't have it. If anyone
does have it they could scan it for us and I'll throw it on my
homepage. I'll eventually get to the rest of my titles and spruce up
the homepage a little. I'll make this a community project and ask if
anyone would like to design a title page. Just send me any designs to
chainsaw1661@my-deja.com don't forget to include graphics if any. I'm
looking to find some Infocom docs and maybe even scans of the props as
well. I used to have deadline for the TRS-80 Model III but I can't
remember what happened to it.

The "right" way to do both of those things (a 3.5 and an IDE) is to use an LS120 drive ($75 from TigerDirect and others). This will give you a removable 120mb (60mb usable) HDD and a really fast 3.5 for SD, DD and HD diskettes.

You know, that is a great idea! I have an LS120 drive in my pc right now that I have gotten almost no use out of in the last two years, since I've had my CDRW. Your suggestion is the best of both for the Atari, now I just wish I had cut up my other ST case to build my 1300XE up, because the LS120's face would have fit in it better (an ST with separate ejectbutton from disk slot).
Can the ls120 really do SD? I just thought it could do DD and HD and 120mb format (on the optical disks of course)

Stupid question from myself to you programers? What the heck has happened in the past 15 years? The programers have gone from doing what couldn't be done with 16k and making it work, then we went to 32k made it work, then to 64k, made it work even better, then to 132K, made it even better.. Then a couple upgrades came into view 320K and 526k, and then 1mg. If someone could program for all these upgrades and still comply with the parameters, then what the hell happened when the IBM type process came up with the memory that was now available to them. Everyone got lazy and just got lazy and upped the limit.. Something is very wrong here, many are just wasting memory that Atari set the pace for and if one reversed the process, where could we be today with limited memory and a very intelligent programer?

I'm not much of a programmer. But those I know are all saying that a background in 6502 programming was essential if you wanted to learn to write tight, efficient code. Most programmers today, those same people agree, are spoiled by ever-growing memory resources. The 6502 and Z80 home machines of the late '70s and early 80's did some wonderful things, it's true, within the confines of small memory and equally small assemblers and high-level languages.

I guess that in those days, the consumer drove the market. Today, the market is driving the consumer. Do we really have a need for spreadsheets with imbedded flight simulators?

Polarity of the connector? I never took my 410 apart but it doesn't have a separate power supply, mine just has an ac cord hanging out of it from it's built in PS, you sure you don't mean a 1010? My 1010 adapter doesn't list a polarity on it, but then again, maybe that's because it is an AC PS, 9v AC(5va) so it shouldn't matter.

From: Eric Cron <ericcron@yahoo.com>
Message-ID: <d4%56.5353$1%2.274575@sjc-read.news.verio.net>
Source record: 39731

I took a BASIC class in high school (10 years ago) - but when I really wanted to learn to program I started using my 800xl (4 years ago). Actually, I didn't want to "learn" as much as I wanted to "play" - I never wrote a program that used the disk drive, so I decided to write a sequential access Contact Manager after I read the 810 chapter in "Your Atari Computer".

But, funny things is that when I finally get into "the biz", what do they use on an RS/6000 with 640MB of RAM with RAID5 running AIX etc...? Yup, you guessed it, BASIC. INTERPRETED BASIC even (PRO/5 - a dialect of Business Basic).

Now I'm the Sys Admin - so I don't write for it, but I probably could, because of the little Contact Manager I wrote for my 800xl, for fun.

Everything is virtually the same still, the programs are still small, just more data. The BASIC interpreter is only given 512K when it starts! Lots of little programs...

Now, granted, there is no GUI (telnet) - Perhaps this is why programs nowadays require so much memory. I can't say for sure because everything I write is still small (shell scripts mostly)...

Anyway - this was kinda off-topic - sorry -

158. "Eric's Atari Stuff" is moving...

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-07 15:28:52 UTC
From: Eric Cron <ericcron@yahoo.com>
Message-ID: <UW%56.5354$1%2.274653@sjc-read.news.verio.net>
Source record: 39732

Hello there -

I replaced my cable modem service with DSL -
so I'm moving my Atari website.

Please start using the following url:

http://www.dislerdesign.com/Atari

to access "Eric's Atari Stuff".

Now that I have it here locally I am going to
start adding content (Yeah, I'm lazy). I would
especially like to finish the 850 manual and I'm also
scanning some Graphics Mode Graphs from
"Inside Atari Basic" by Bill Carris. They
will be pdf files -

Now - if I can just get the cable company to
get rid of the old site!

159. Idiots Guide to Atari 8-bit RAM upgrades - takers?

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-07 15:59:50 UTC
From: Eric Cron <ericcron@yahoo.com>
Message-ID: <Wn066.5355$1%2.275009@sjc-read.news.verio.net>
Source record: 39733

I know -

If you can't figure out the instructions
that are already out there, perhaps you
shouldn't be taking a soldering iron
to your 8bit.

But -

I don't suppose we could get some volunteers
to draw up some nice plans? That Newell 1 megger
looks really complicated, and from what I can
tell, the 256k upgrade looks alot eaiser.

What I have in mind -

Cool parody graphics of the "Idiots" book - (I'll do this part! :))
Radio Shack part numbers (and Euro counterparts)for -
- Good soldering iron
- Types of wire
- etc..
Step-by-Step instructions that anybody with a brain could follow -

I tried to get RAMBO-XL, which I heard had pretty good instructions and
parts from B&C a while back, but they don't have any left.

Heck - let's make our own kit! I'd be glad to stock them and sell them at
cost for all of us. In short, I'll do what I can, but I can't write the
instructions.

Maybe this will get us going:
The C64 is WAY ahead of us in the hardware area...

Comments?

I agree bob I used to program better in 6502 asm with 32K than most PEECEE Programmers with 16MB their code is fat and bloated when I code on the "I Know Shudder" MAC my code comes out 1/8 - 1/16th the size of my Partners code on the PC Doing the same thing so I think it has a lot to do with the programmer and not so much the machine.
Just my .02 cents

Hi !

About this problem:

What is wrong when my Atari 1050 DD is acting like there is an unformatted floppy disk in the drive? It also gives BOOT ERROR (like an unformatted floppy)
I tried another 1050 diskdrive and then it works ok (so it isn't the cables or computer)

so euuhhh HELP!

Thanks anyway

Erwin

Source record: 39738

Sounds like the common 1050 problem discussed here:
http://www.atarihq.com/atcomp/1050fix.html
But first I would take it apart and check out the drive belt, if it has sat for a long time the belt could have gotten a 'set' to the shape of the pulleys of the motor and hub, in which case it throws the belt off the first time it tries to spin, and then you get the endless boot errors also.

good luck,
BG

Part of the problem lies in the fact memory is cheap. Back in the 80's even memory was expensive, so we used 16k or 1k and did a lot. Today we have plenty of memory and we exploit it. One of the bigest wastes of memory has been the C language and its libraries. If you need a single routine in a library, you get the whole library. Not to mention if you start using OO stuff. Then you get the parents legacy as well as its childrens.. all that makes nice programming. But it is fat programming. GUI stuff also eats the memory like crazy. Anyway, you are right... programs are bloated. I suspect the next major guy in software to make money like Bill gates will be the guy who writes Microsoft Word that is cheap with understandable simple options, and it is efficient. Kind of the software equivalent of the CISC architecture to RISC architecture change. Transmetta maybe close to this..

my 2 cents..

That would be Wordsworth on the amiga then :) (excuse my swearing BTW)
Gives me all the functions i use on word for windows (including wysiwyg,
true type fonts, cut'n'paste, tables on demand, inserting pictures columns
and the like), on a 68e020 with 2 meg of ram. its still slow, but imagine
what speed it could do on a modern PC specced machine! (waiting for next pay
cheque and impending accelorator purchase)

Another problem on PCs is the many differnt options of hardware, several
graphics chip sets, several sound chipsets, several processors to choose
from! Programming nightmare!

Bar the games, i could get by with a 16meg 486/100mhz, soundblaster pro and
a basic SVGA set-up with a couple of megs video ram and a CD drive! word 6
was about the best, then 95/97 saw it bloat/go down hill from there under
added functions that i never use.

Now if Sony released an add on for the PS2 that gave me a resonable
keyboard, a hard drive (or equivelent device) a removable media device
(floppy?) with a basic package with the funcionalty of works, with a web
browser and mail and news client, i would be a happy chappy with an all in
one home entertainment system (good games, DVD, word processing, e-mail and
news, web browsing, the most people usualy use a £1000 pc for anyway!) The
chances of it working/selling are zilch though! because the world wants PC
compatability (though often its not so compatable) But, I would still keep
my atari for old times sake because emulators just don't feel the same!

Source record: 39745

Bob,
With all due respect. Things are a lot more complicated than when we were cranking out programs on our Ataris. Don't get me wrong, I love my 800. I started my career on that machine. I does and will always hold a special place in my heart. I also couldn't imagine getting rid of it, but let's be realistic here. 48K. I have a camera that makes a picture that's 900k. The low resolution picture is 100k. I will admit there is bloat in programs, but step back a second and look at the complexity involved. You might have 100 programmers working on 1 program at a time. That would have never happened on the Atari 800. Just keeping source control straight is a full time job. I realize this is an atari newsgroup and we are all here because of our fondness for our atari's (me included), but things are moving along. What you are calling bloated code is just code that is moving along with the hardware. I bought a 20 gig hard drive for $70. My first box of floppies Elephant's SSSD were $50. As a programmer, it's about reuseable code, since there is so much coding to do, and this by definition will take up more space in order to make it reuseable. There are also a lot of tools that do a lot of work and take up a lot of space so that people who don't need to get down on the ground level can write code. Why should you have to worry about interrupts when you don't have to. If I just need to get a program to store some data, why should I have to worry about printer drivers? Things are changing, and only for the better as far as I am concerned. There are still some amazing things being done, and how do you know that they aren't in a small amount of code? Do you look at code from a current development platform?
I think that it is just a generalization that code is becoming bloated. Take a look at what it is really doing, and you will see that it is just evolving with the times. I am still amazed at what you can do in 8k, but some of the programs out today amaze me as well and I just accept the fact that they are going to take up more room. You can't have 35mm quality pictures in 48k. And yes, I am printing my pictures out on a Sony UP-DP10 Dye Sub Printer, and they are 35mm quality. You can't tell the difference. Glossy coat and all.
Technology, ain't it grand.
Isaac

There is quite some information on the real tapes in 'de re atari' but
the files created from the tapes might look quite different.
BTW, I got one example file which in parts matches the tape format
description but has some surprising information in it which I
don't know whether it's typical or not.
I will continue this project sometime during the year but at the
moment it's not the top priority item on my todo list. But maybe
that will change when I'm able to get additional information.

There's the description of the file format in the readme file of
WAV2CAS. If you want, I can send you quick and dirty Perl script which
does print the block headers etc...

On Mon, 8 Jan 2001 at 13:13:56 GMT, Jorge (dirty dott fly att teleweb
dott pt) scribbled:

->... 1050 disk drive, but the drive when i conect it doesnt do
->anything apart from lighting the botom led (power one) it doesnt even
->'initialize' the drive, what should i do ?

Sounds like you expect everything (computer and drive) to work like
a system with a hard drive. (That is, without necessarily using any
floppies.) Not so. The 8-bit is a floppy-disk based system. You need
a 5,25-inch floppy disk with a DOS program's master files on it. (DOS
= Disk Operating System.) There are many DOS programs. Their main
file is usually called DOS.SYS. Some DOS programs have an additional
important file called DUP.SYS. After turning on the drive and
inserting the master DOS disk, you then turn on the computer. At that
point the system will "initialize."

OK, with a disk in the drive, the door closed, when you power up the drive
the disk should spin and the drive activity light come on. This is if the
drive is attached or not to the Atari computer.

Since you say nothing, I assume you mean that when you have a powered up
drive attached to the computer and power on the computer you don't hear
anything. If you had heard a high pitched screeching sound, it usually means
the 12V power supply is out.

In my experience<someone will jump in and tell me WRONG!> the 6507, 6810,
and ROM in the drives are pretty robust, they seldom go out.

That pretty much narrows it down to the RIOT/6532 or maybe the 2793/2797
controller. I would bet the RIOT.

But the best standard advice we have had over the last 10 years that seems
to work most of the time is to just leave the thing on overnight then try
rebooting. What seems to happen after any piece of Atari equipment is left
off for an extended period of time is the pin/socket contacts stop working.
Could be forming a metal oxide, could be galvonic, could be anything, but
leaving it on overnight seems to work a lot.

Is there a version of Bobterm that supports the 14.4k speed? The
version I
have will support 9600 and 19.2, but not 14.4. I just picked up an
external
14.4 Sportster for $5 at Goodwill and even at 9600 it's been a vast
improvement
over the $200 2400 baud modem I bought ages ago. Of course I only
telecommunicate about twice a year on the XE, but still....

I had the same problem with my Happy 1050. What I did was I took the
cover off the drive and put an old copy of DOS in it. with everything
powered up, I adjusted the parking sensor a hair at a time back and
forth while rebooting until I got a boot.

Technically you could use an Epson inkjet with just an LQ driver. This is definately the case for the ST. 1st word and a 1040STFM driving a Epson Stylus Colour 640 is no prob. Most new printers i.e. Lexmark, Epson 680 etc, and Canon's won't work as they are GDI printers and they suck.

Ok.. I can't stop b!tching about this...

There is definitely bloating. Isaac's picture is a good example. a 2M pixel in 32 bit color takes 8Mb to display. But when you apply the proper transform on it and entropy encode it, it takes approximately 100Kb to store (JPEG format). So here you have 100K worth of info, but to display that takes 8M a 80X increase. This is inefficiency..

Software is similar but worse. What is efficiently encoded in 64K could easily bloat to 6M. Take for example a Word file I was working with today.. originally it was a Word 97 file-- 13.2M. After I loaded it in Word 2000, it saved out to 24M! Yes I know it has "added" features now, but it grew by roughly 2X for the same file!

Just remember, most monumental increases in perfomance and features tend to come from innovative new ideas or algorithms. Not from increasing memory or processor speed. (My old advisor used to hammer me on this.)

Usually, a standard Epson driver will work(FX80, et all), but only if the inkjet supports Epson mode. I use a Canon BJC-4100 that does support epson, and it works well. No, not in color unless the software knows how to use it. I haven't played with color graphics much yet.

When looking at color inkjet, check the manual to see if it supports Epson or IBM(older) in a section about using drivers. If it only talks abouts Windows, Windows, Windows, or Mac, Mac, Mac, then it won' work. Many new printers are very much gui dependant now.

This same is true for other printers. I use a HP Laserjet 6L for text, and a HP DJ500 as well with its FX80 cart. My color Canon works on the ST with a LQ2550 driver.

The only other thing to note is that you must turn off top and bottom margins and set the page length to 60, or use legal paper(as I do with Atari Planetarium) as the inkjet page appears longer and you can't change margins.

Wooaaa.. It takes 8MB because the raw data *is* 8MB. Just go and compute
what amount of memory you need to encode 24 bits per pixels for a reasonably
large image. The compressed image is much tinier because jpg is a quite good
image compression and removes *visual* redudancies, i.e. it is a *lossy*
file format.

So long,
Thomas

Source record: 39625

Hi, I have a few boxes full of Atari stuff I need to get rid of. I'd like to sell the whole lot, but I'd be willing to sell it without the monitor and printer if need be. The buyer of course, pays shipping. Make an offer I can't refuse and it's all yours.

130XE w/"Strange Unidentifiable Modification"
- Has a rotating switch on the back. This unit was puchased from a hobbyist in the late 80's and I have long since lost the manuals for this modification, so I can't tell you what it is.
-Looks great, no stuck keys or anything. I think I have the original user's manual as well.

2x 810 Disk Drives
- One is "Happy Enhanced" or something like that. Quite a bit faster than the other.

410 Program Recorder

Atari 830... Correct me if I'm wrong. I think this is an RS-232 device? Used with printer.

Star Gemini 10X printer.
-Hasn't been used in quite some time. Almost surely needs a new ribbon.

Amdek green-screen composite monitor.
-Works like new, but is unfortunately only a green-screen composite monitor!

Miscellaneous disk/tape software. I might even have some cartridge software and manuals lying around, I have to check.

Thanks,
-Micah

205. Help!! - Music Menus

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-09 11:01:34 UTC
From: Steve Pearsall <darius@lineone.net>
Message-ID: <979038127.23266.0.nnrp-12.c2deb3de@news.demon.co.uk>
Source record: 39629

Hi there.

I'm after a bit of help, please.

Many years ago, I had some compilation discs with (I think) 2 music menus on them, basically the theme music from about 25 different XL games, with a skull and cross bones in the left corner, title to the right, and listed down the screen a list of all of the music (obtained, somehow (?)).

Unfortunately, I don't know what the title of these programs are, but I'm eager to get them in ATR (emulated) format.

Can anyone help at all??

If you have original programs or unique data on your old floppies, you
should preserve them by generating a disk image of the floppy which
you upload to the Internet somewhere.

Or it could be lost forever!

>want to look for a Black Box interface. They can handle the 512-byte
>sectors.

There might be an upgrade around to fix this. I read a long LONG time ago, that somebody sent his MIO in for an upgrade (at ICD) and when it came back, a drive formated on a MIO could be read on a BlackBox independed of the 256/512 bytes per sector switch.

Message-ID: <93f0s3$9ej$2@nets3.rz.RWTH-Aachen.DE>
Source record: 39632

Howdy folks

I'ld love it if MyDOS could handle more than 16MB per partition. Problem is, how do you wanna do that.

At the moment, MyDOS uses two bytes for the '(next) sector link' and one byte for the amount of bytes that are used in this sector. That's three bytes. The rest is used for data.

Increasing the number of bytes used (now three), increasing the number of sectors used or increasing the size of the sector will mean that the disk can only be accessed by the new version of MyDOS.

I'ld leave most command's that were mentioned previously as they are. If you have to format a drive using 1440 bytes or more, you are probably using a piece of hardware that, like the BlackBox, has formatting code for these cases built in.

Double sided enhanced density and double sided single density are AFAIK a waste of memory, as most double sided drives are capable of double density. And no software needs DS/ED or DSSD.

But I do have a couple of wishes myself:

- a fix to the NOTE/POINT bug
- Time and Date in the unused 128 byte of a DD directory. Existing DOSses don't read or write to this area. But coding should be better then SpartaDOS, as Sparta uses some funky system combined with binary coded decimal. The time could be stored in hex coded military code. An option in the menu would toggle between e.g. 13.27 and 1.27 pm. Date could be coded backwards YYY:M:DD (in hex). There are only 12 month, so we could use 3 nibbles for the year (4096 years should be enough), one for the month and two for the day. That would make 6 nibbles or 3 bytes for the date. Plus 2 for the time, makes 5 bytes. Which leaves 11 for different things.
- a version on cart. Not like Sparta 3.3c but like SDX. Read: a SMART cartridge!
- a fix for the /X bug
- Boot with or without MEM.SAV
- a fix for the append bug. You need an extender or atleast a period if you want to append files
- add an option to RAMBOOT (usually called RBxx) so we can leave RAMBOOT without RAMBOOT doing anything when cold booting without powering down.
- If I press a key to tell RAMBOOT what I want, this key should be displayed.
- Disable the possibility to format drive 0. Which in reality formats D1:
- If MyDOS thinks there is no RAMdisk and RAMBOOT finds one anyway, D1: is formated. This should be fixed. Maybe this is related to the problem above.

- Toggle non-sorted/sorted directory
- Show an error when a file is not found during copying.
- Ask permission to replace file if a filename already exists when copying.
- If a filename exists or can not normally be handled by MyDOS, it should be possible to change the name without aborting copying.
- When RESET is pressed when for instance 'D8:subdir:' is the default drive, 'D8:' remains, but 'subdir:' disappears. 'subdir:' should stay.
- When copying (and not using a period. MyDOS only needs a period between extender and filename when the filename is shorter than 8 characters and an extender exists), sometimes the first character of the extender disappears and the rest is moved forward one place. This should be fixed.
- When an illegal character, e.g. '^' is entered in the filename, MyDOS should tell us that. As it is, it just tells you that the file is not found in this directory.
- What would also be a nice feature for a new version of MyDOS would be this. Subdirs with an extender like '.sbx' (where x would be an alpha numeric character. The first to be used would be zero, then after 9 would come a. If '.sbx' would be in lower case (MyDOS already allows this and since MyDOS is the only Atari DOS compatible DOS that supports subdirs, this would not be a problem) the chance of a file looking like a subdir (to the human, MyDOS know what is and what isn't a subdir) is small to none.) would look like any other subdir on existing versions of MyDOS, but the new version of MyDOS could make them look like part of the main main directory (or any other directory these '.sbx' subdirs are found in) to the user. That way, you wouldn't have to be concerned about the 64 file maximum per directory, while the partition could still be read (in total) by older older versions of MyDOS.

That's it, for now. :-)

>

It depends on two factors: the make/model of the printer and, the Atari software for which you want the driver. Several years ago I wrote driver files for PaperClip to use an HP DeskJet 500, but obviously the driver would be useless on a printer that doesn't use PCL and equally so with any program other than PaperClip.

If you're looking to run something like DaisyDot, you can pretty well forget it as you'd be asking the inkjet to _emulate_ a low-res printer. While this might be possible on an Epson or compatible, the results would be poor and the expense (ink) high. It would be cheaper to buy a used dot matrix printer (around here they go for $10-$15 Canadian and a brand-new ribbon can be had for about the same price--a total about 2/3 of the cost of one black ink cartridge).

Since I could run a DeskJet with PaperClip, I see no reason it couldn't be done with Atari Writer as long as the driver file allows sufficient space for the, possibly, much more verbose command language (PCL).

I paid the registration for Rainbow from Chris Lam which is much higher priced.
It has 3 screen sizes, small (single scan line), medium, and large (dual scan
line).

Personally, I like WACKE best because it supports the cassette peripheral,
which to the Mac is just an ATASCII disk file, i.e. no formatting required,
just the right characters from the Atari character set.

Phil, you sound like me. I, too thought of making a project for such a program. However, I like colors and would like to use a 4-color mode. Maybe it would be nice to be able to switch between 2-color, 4-color, and 16-color (GTIA) modes.

As a programmer, I'm also interested in a GUI OS that sports a built-in programming language. If security isn't an issue, then I have started working on a programming environment that allows all loaded programs to interact with each other, but OS data, of course, are private.

I have written an ML routine small ML routine for some basic bitmapped graphics operations.

Oh, if you support the Atari 800, then I'll be sure to try it out.

Hey guys!

I'm not sure what the status on the project is, sorta seemed liked we couldn't find a cheap enough development package and it got dropped.

Well anyways I just wanted to let you all know that i've shifted focus to a cheaper platform for anyone interested. There's a really cheap ($99bucks) peice of hardware out right now called "cybiko" I got one for me and my dad, still in the playing around phase though.

I've tried compiling the atari800 emulator for it, it went up till it started asking for stdio.h. Ok I found that, now it wants stdlib.h. Sooner or later i'm gonna get this damn emulator to run on this thing.

Yeah so all you fuji guys that sorta dropped off the project, come on back, we got a cheap dev platform now so we can get past arguing hardware specs and get straight to making a handheld A8.

Yours Truly

I tried to get it to work many years ago never did. The problem with S.A.M. is that it came on a copy protected disk that had DOS 2.0 on it and in order to use it you had to boot the S.A.M. disk. I don't know if anyone ever broke the protection. I'd give it a go again but everything is in storage.

A few years ago (1996-1997 maybe) I found SIO2PC software on the internet, built the little device and archived the most important stuff... It's safe now...

Then yesterday I downloaded an emulator, made a disk image out of some files that I had on the CD (it was in 1997) and played a bit.
It was cool but nothing compared to the real thing (and half of the games didn't work).

I'll try to free a bit of desk space and install one of my old Atari. Still have a 130XE and my original 800 in good working condition with at least a couple 1050 and the 850. I probably still have the board I made for SIO2PC also...

Was there anything new released for Atari 8 bits in the past 15 years ???

Well, the description said there aren't any bite marks on them :-).
Quick, put a couple of joys up before the other bidder (who bid $50)
gets away. Maybe I'll email him first. Offer him 20 sticks for $500.
Seriously, I agreed that this one is pretty inexplicable considering
the winner has 129 feedback - meaning he has plenty of auction
experience. Maybe bad dosage on the ol' medication ?

Well, not to sound harsh, but if you don't like it, then write your
own. That's about the only solution I see. Sitting around complaining
isn't being very innovative either. I seem to remember the same
arguments about the ST line. Why do you need 512K? My 48K is just fine.
Well, my 800 does what it does just fine, but it has it's limitations,
and I accept that. Evidently some people haven't.

I did crack that one many years ago, it used the double sector protection, all I had to do was change a bne to a beq, no big deal. I did see a bin load file of it somewhere, but I think it still loads in the same space as Sparta.... oh well I thought maybe someone knew something I didn't, thanks

I am a collector of Atari 8bit carts, and am still looking for over 200.

Do you have any carts you could part with. If so, please let me know
a list of titles, and how much you'd like for them. Also, a very brief
condition of cart would be good.

I am willing to pick up some titles that I may already have as well.

Anyway, if you do have some to part with, please let me know.

Regards

Aaron
New Zealand

PS - I can pay via Paypal or with US or NZ cash.

You can download latest emulator version from
www.a800win.atari-area.prv.pl
It includes zlib.dll.

Howdy Bob, folks

Don't forget that trying to make code compact and 'looking nice' is expansive in two ways:

a) If the software does what you want it to do, changing it just for the above reasons costs money. Buying memory is way cheaper than having somebody work on the software longer just to make the code shorter or nicer looking.

b) Compact code isn't always easier to understand, so modifying it (bugfixes or upgrades) gets harder

c) 'If it aint broke, don't fix it' You have a working piece of software. How says it'll still run after redoing it.

CU Mathy van Nisselroy

PS they told me this at the university. How come I'm having trouble with this class?

Howdy folks

> Does anyone know if there is a printer driver that will drive an inkjet
>printer for an Atari 8-bit?

I own a Canon BJC 4200. It does EPSON, but DaisyDot works better on a
dot-matrix printer. The Canon turns round dots (which you'ld get on a matrix
printer) into squares. But if somebody is willing to write a nice printer
driver for a Canon and Atari combo I have a nice piece of info for you.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

I was playing host at those chats, and would advertise them by posting here, and come up with topics. We even had a quiz and gave away a prize (Preppie II). I screwed up the quiz because half the people knew way more about the Atari 8bit than me, so I couldn't come up with good questions.

We did the weekly chat for like 7 weeks and it was really fun. I had started taking some classes and between that and work became too tuckered out to enjoy arranging and participating in the IRC.

Now I have enough time to enjoy the 8bit scene again! We should restart the chats, maybe make it an on-line club or something. Got any ideas for topics? How about "Rare Software?" "Telecommunications Revisited." "Poland's Atari 8bit Expressionist Period." We were joking about "Atari 8bit Porn" as a topic.

what a change it definitely has been. I can live with the "bloating" considering the ram prices & hdd prices. what I dislike is that along with the bloating came bugs galore. back in the early days, when a piece of software hit the market it worked as advertised. in the new bloated software universe, bugs are commonplace - we learn to work around them until the next patch comes out to fix them, which in turn creates new bugs. when it comes to software, i miss the old simpler days.

It has only a 11 MHz CPU. That means it will run no faster than 10-20% of
Atari speed. And it has 160x100x4 display (Atari has 336x240x256).

Subj: <version> version of Westfront PC planned :)

Text:

As some of you may know, I have been working on porting my
game, Westfront PC: The Trials of Guilder, to Atari 400/800 format, as
well as others. Currently, my game is only available for the following
platform:

IBM PC/Windows 9x/Me/NT/2000/Whistler

I wish to port Westfront PC: The Trials of Guilder to multiple
formats, including the Apple II/IIe, Atari 400/800, Spectrum, DEC
Rainbow, TRS-80, CP/M, Unix/Linux, Macintosh, Commodore Amiga, as well as
(it was originally coded on) the Commodore 64/128.

For more information, please visit my website at:

http://www.geocities.com/dunric/westfront.html

Thanks! :)

Dear All,

>
> > " Atari 800XL is still used in one of the biggest Czech hospitals, for
> > diagnostics of children with heart problems."

I also read somewhere that 800XL's are used for auto engine diagnostic checks somewhere in the US. Should be easy enough to come up with the tester that is attached to even a joystick port, let alone tape drive port.

> one? Also what is "Turbo2000"?

Turbo2000 is a little device, a self-made card with a couple of chips that you put into your 1040 tape drive to speed up the loading process. I made one of these for my 800XL - got the chematics from some Polish magazine in 1990. It worked great - you load the small boot program first at the normal speed and then you can load/save compressed programs. Normally with Turbo2000 it took me like 40 seconds to load a 16K game... funny to recall this when I am downloading the stuff off of the Net now.

250. Can one save a cart as an exe or com file in an emulator ?

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-10 20:38:09 UTC
From: ronfucci@my-deja.com
Message-ID: <93ih7g$f0b$1@nnrp1.deja.com>
Source record: 39574

I assume this can be done since I see software I would expect as a cart available as a com or exe file on ftp sites. One example of this is Pacman. If so, how to do it ?

If the cart contains cart specific logic e.g.write to the cart memory area, can the code be disassebled and no-op-ed ? I guess I'm asking if anyone has attempted to do this.

It seems to me there is a constant desire for 8 bit carts (as shown by the market traffic on ebay) and this would be a good way to distribute cart code (if permitted by ownership).

Just a curiousity.

The orginal hack I can think of just required you to have an Atari 800 with a BASIC cart plugged into the left slot and the cart you wanted to copy in the right *even* if it was supposed to run from the left cart.

This was really hacked code, used illegal jumps to the OS, that kind of stuff. At one time I patched it for entertainment value and uploaded the patches to the newsgroup.

A later solution was just one of the after market OS ROMs that came out. They allowed you to break out of any cart to get to a monitor program in the ROM. Once in the monitor it was as easy as giving a boot DOS command and from there choosing a binary save option from the menu.

IMO: It has more to do with collector value of the cart vs the game play with a few exceptions. People are still gladly forking over $20 to buy a copy of MULE to play it, but they would pay $100 for a rare game that sucked and was never played.

For what it is worth, the 11 MHz CPU is not the current problem. Matter of fact, time trials I have run so far indicate that it can match an emulated Atari 6502 almost exactly, less then 10% difference. H8 processor is a 68000 16 bit processor type derivitive so if Xformer ran to your satisfaction on an ST, you should pretty much expect it to run OK on a H8. There are a few other hacks going on that the jury is still out on. Someone has hack their Cybiko up to 20 MHz. Problem with 20 MHz is they use an Atmel coprocessor in there and the information I have is the eeprom does not work right at those speeds even if everything else does. Not to mention it will also probably throw off all serial and RF communications.

The problem is the way Cybiko implemented the system design. As far as I can tell, everything they do *is* an emulator. They have something like a ~900 byte kernal that is a processor emulator in itself. Reading the lit, it says they did this to make software development with things like a C programming language easier to make.

I'm not sure if this problem can be beaten. That is I don't know if you could bypass the CyBiko "Optimized for C processor emulator" and replace it with "6502 emulator.

The 160 horizontal in 4 shades of gray isn't bad. Roughly equivalent to GR. 15 on a black and white monitor. Vertical and other modes are a problem of course.

But yeah, the whole project is full of problems just from a freshman physics standpoint. That's what make it fun for me anyway.

Low power processors with huge number crunching ability is kind of an oxymoron. Lowest cost DSP kit right now is the EZlite at ~$179. DSP development kit from Lucent was something like $7,000 last time I looked.

These processors suck up 5-50 times the juice of something with a little less horsepower. TI is pretty reasonable in bang per buck, but there hot kits cost ~$300.

Cheapest LCD display that will accurately emulate an Atari's display are in the $300-$600 range.

Right now the low power processor/controllers are just starting to catch up to what an Atari ST<any 68000 or '286 based processor of the era really> could do in 1985.

On some levels the Cybiko proves the concept almost perfectly. Modern low power 16 bit microcontroller emulating a processor and running in a hand held computer. Just they didn't emulate the 6502 or the Atari computers.

I've been trying to get GNU stuff to compile for days, I
allmost got atari800 compiling on the sucker but when the
makefile calls configure.c it makes includes for the following
libraries....

#include <stdlib.h>
#include <string.h>
#include <ctype.h>
#include <signal.h>
#include <setjmp.h>

BTW the goal right now is just to get the basic version working. I
want my "READY" prompt.

I believe you guys are looking back through rose colored glasses. No bugs? Worked as advertised? That's why Atari Basic has a revision A,B, and C. How about Dos 3. It might have worked as advertised, but that was some lousy advertising. I do remember it having bugs. Even hardware had it's problems. I had to put in a modification in my MPP-1000E modem because it came from the factory without the ability to hang up the line. The mod came straight from MPP, in fact it was promised in the manual. Made for some fun BBS sysoping when the line wouldn't hang up.

Along with more complexity, you run into more chances to have a bug. Oh well, this could be one of those never ending arguments and no one is going to change anyones mind. I just like how everyone looks back on things and they were so perfect back then. Why did we change? It's called progress and we aren't getting any younger. The old bumper sticker holds true: Lead, follow or get the hell out of the way. I hope no one takes me out of context on this. I love my Atari, and wouldn't know what to do without it, but I also acknowledge that we are progressing at a rapid pace. Larger more complex software is just part of it. No software is bug free.

Would you replace the ROM P: driver or just add a new "J:" device for jet control? How complex is the PCL? How likely is it to fit in block of RAM we can spare? It would be much less convenient as a stand alone app similar to Daisy Dot.

Not sure exactly if I am answering the question you are asking, but yes/sort of.

Specifically I have made backup copies of both my Omnimon and Omniview OS ROMs and used them with the Xformer for DOS emulator. All I had to do was move the binary images into the directory and rename it according to the Xformer convention, something like 800XLOSB.ROM or whatever it is called.

Once the emulator booted I had access to all the Omnimon monitor functions: Read/write sectors to disk, disassemble memory, mini assembler, trace, etcetera.

I don't really use the emulators a lot, about all I ever did was boot it and say "Oh this works, how nice", so I am sure there are some details I am leaving out. I also did some odd hacks myself like OS ROM image with the fast floating point routines.

As far as availability to you: I don't know if they are still available for purchase. I don't know if Newell released them to the public as he did with a lot of his stuff. I don't know if the rights are owned by someone else currently. I don't know if they are on a pirate site. I am really out of touch, most of my Atari stuff is getting covered in a thick layer of dust.<grin>

As far as the other OS ROMs that add this type of functionality, I never tried anything but the Newell ones and my own. I would bet others would work. Maybe someone that still sells OS replacement ROMs like Steve Tucker could comment on.

These modems all use data compression, so the software should be able to send the data faster than the maximum baudrate of the modem (my SupraFaxModem is a 14k4 modem, it's maximum speed is 57k6 on the computer to modem line.). You need an interface that will do hardware handshaking to get above 4800 baud reliably. I'm using a BlackBox, BobTerm is always set to 19k2 baud. Since that is the fastest both will go. With a mod, the BB could go faster (but somebody would have to develope that mod. Bob Puff already wrote some code for this mod.).

CU Mathy van Nisselroy

PS the MIO can do hardware handshaking too, but you need Len Spencers high speed drivers. There are also high speed drivers to improve the speed of the BB (a little) by Len, but for some reason, I seem to be the only one having problems with the BB driver Len wrote.

I don't know what US copier program does. But I suspect it doesn't
check for extended memory, just available memory in the first 64k.
There was a Newell program that checked memory expansions.
Also, if you run Disk Com 3.2, by Bob Puff, it will detect expanded
memory and ask you if you can use it.
Another thing is to use a RAM disk utility and see how big a RAM disk
you can make.
I don't think anything is wrong with your computer.

Actually it does what I said, it uses a discrete cosine transform on it, then the bits are entropy coded. But riddle me this, if it is a more efficent encoding, why not build the hardware to exploit it? (I am not sure and would have to look, but I think some 3D video cards have started using compressed textures)

Also, JPEG does not have to be lossy.. typically it is to improve file size.

Granted the old hardware has limitations. It is 20 years old. I agree with you that nothing ever is fixed by constant complaining about it. (Doesn't mean I won't complain more ;)) I just think there is a market for the smaller more efficient software.

It just seems to me that a smaller more efficient solution is a more elegant and preferred solution. This isn't just in software but all engineering/design. The US car market of the 70's is a lot like the US software market today. They don't care how big or inefficient their product is, and if you don't like it they tell you to go buy someone else's then laugh at you. With the software talent in other countries developing, I expect in the next 10 years to see US software companies experience the same fate as the auto manufactures did when Japan brought smaller, better, more efficient products to the marketplace.

I thought there was a very interesting article that kind of pertained to this subject in the December 2000 issue of Computer "Why Johnny Can't Program" by Neville Holmes.

I can't read the article (not a member), but your comments are correct.
I wasn't meaning to imply that there isn't any bloat, just that I can
live with it and actually expect it. I think the term "User Friendly"
is one of the main causes of this. If Joe User was smart enough, we
could probably elimnate 80% of most code right off the bat, I think
some of the increase in size of programs has been to make it so that
people don't have to learn how to use things. Wizards are a prime
example. Useless to anyone actually wanting to do anything, but almost
demanded by the people who can't.

Java is another prime example. If you look at what it takes to
print "Hello World" on the screen, you would choke, but it's all in the
name of simplicity. While java itself isn't simple, the simplicity lies

in the write once, run everywhere philosophy. This has caused Java to use some incredibly complex code to ensure that you can run java on any java based platform.

I just don't think you are going to get the complexity that software has these days without having the bloat. They go hand in hand. If you can rewrite some of the common apps today taking less space and keeping them simple enough for everyone, then you could be the next microsoft. No one is stopping you. That's the difference between the software industry and the Auto industry. You can write a piece of software and distribute it to millions easily. You would have to build millions of cars and figure out how to get them to the customer if you wanted to make your own. Autos are far different than software. Cars are personal everyone customizes their's in their own way. Business software is all about compatibility. They all need to be the same (on a certain level). If you create a document and it's a customized format, then only you can read it. Not good business sense.

This is the beauty of the internet. I am sure there are millions fed up with this. You should all band together and create your own standards and software. It's being done with things like freedos. Look at Linux. I just think you are going to have the same kind of fight. Acceptance in the business world takes a majority and until you get that, it's a fight to stay afloat. Me, I don't have the time to do anything about it, and frankly just accept it as growing technology. Hell, I barely manage enough time to squeeze in a reply here and there.

282. 130XE with 56K

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-11 21:19:58 UTC
From: Erwin Vicari <vicari@cybercorp.getxs.nl>
Message-ID: <93l8d0opp1@azure.nl.gxn.net>
Source record: 39503

Hello 8bit enthousiasts!

I am really stuck with this one:

somehow I have been lucky by trading my box of empty CD recordables for a
130XE in excellent condition! (but...)

When I tested the computer with some games, the games were fully loaded,
displayed and sounded in full, but the keyboard or
joysticks would not react (games like Blue Max)
When I tested Miner 2049er, the computer works well.

So now I tested the computer with US copier, this program gives the
available memory, and says 56K!

Are my memory chips broken? If this is so; how can I get new ones?

Houston; we have a problem!

Thanks anyway, my friends!

>who want's some games.

Simple matter of LOAD"D: & SAVE"C: if they were Basic files. Single stage disk boots will convert directly to a boot tape with a little Tap2Dsk software. Unfortunately, most disk apps boot a few sectors and then go into random access mode; this leaves the purely sequential tape out of the action unless you completely rewrite the loader code.

I don't think it was ever available as a cartridge; usually it was a replacement ROM for the internal OS. You could either simply swap it out or put both the stock OS and the new ROM into a special printed circuit board that plugged into the OS socket; the pcb was wired to a switch fitted to the case for selecting the active chip in a multi-OS arrangement.

If your hardware will support the higher speed, try the 19.2k setting.
That's what I did to get a 14.4k modem working with my ST. It didn't have
the 14.4k setting in any of the software I was using, either.

The problem I had with using a 14.4k modem on my XE was my interface. I was
using an 850 and 9600 was as high as it would go. P:R:Connections wouldn't
go higher than 9600, either. I remember hearing that late-model
P:R:Connections wouldn't go THAT high.

291. Montezuma - What's going on?

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-12 03:40:04 UTC
From: Itay Chamiel <itayc@surfreespam.net.il>
Message-ID: <93lu8ijce1@news.netvision.net.il>
Source record: 39459

Hello,

Just for fun I decided to play a nice long session of Montezuma's Revenge. There are two versions floating around, one is called "Preliminary Monty" and is a prototype, the other seems like the commercial version of the game with a proper title screen and music (and a little sombrero on our hero's head too).

However, it too seems like a prototype. First of all, the game (even the first level - if indeed there are any levels at all, like in the prototype) is very difficult - the only way I could actually make progress at all was through Atari800Win's save game feature (by the way, anyone who hasn't seen the new Atari800Win Plus should go get it). Secondly, there are bugs. It is not uncommon to see stationary enemies (that look frozen), enemies placed beyond the borders of the screen, rooms in which a corridor is not blocked by a wall but still don't lead to another room, and other strange behavior. And third, I couldn't find my way out of the first level, which is supposed to be easy. I did make progress, found myself solving puzzles, I even reached a "boss" enemy (whom I couldn't destroy in any way), but no way out of the level in sight.

So.. Am I playing the wrong version of the game? Or is it the correct one - and if so, what am I doing wrong? (the bugs I mention also occur on a real Atari, the fact I'm playing on an emulator isn't significant here.)

Omnimon was never available as a cart. Its an eprom, with versions for
the 400/800, and one for the XL/XE.

Actually, the most likely cause is a very dirty head. Its the shiny part that points up.The part that points down is the pad that needs to stay dry. A wet cleaner works great.

How about...
unplugging everything from the SIO port, and then hold down option while turning it on. Let go of the button when the screen turns blue. Then select memory test.

What does it show?

P.S. does the keyboard react to the keyboard test? When booted to basic? If not, then it could be the "pokey" chip.

Hi, I'd open it up, and look at the circuit board. It may be marked. If not, I'd look at the center pin(probably a barrel connector) and see if it goes to a traces that runs all over the circuit board. If so, its ground. If the other one does, then the outer conductor is ground.

To verify, I'd setup to boot a tape, with out actually inserting one, then plug the power in, if nothing happen, pull it out fast.

Indrema is coming out with a console based on a PC (like MS is with Xbox)
which runs Linux.

It'll come with Ethernet (modem optional), 4 USB ports in front for games,
2 USB ports in back for peripherals, 10GB or bigger Hard Disk,
e-mail client, web browser, MP3 player, DVD player, Personal TV features
(a la TiVo, Replay and WebTV), and...

AND... it runs Linux. :)

People are already considering getting StarOffice or OpenOffice running on
it. >:^)

It should cost about $300 for the first model (L600) and be out by fall.

See: http://www.indrema.com/

And if you wanna develop for it (the SDK is free, freeware certification
is cheap, and there is no licensing cost for freeware software), see:
http://idn.indrema.com/

This page renders kinda oddly for me. The left bar is blue with black
text.. very hard to read. Plus, the text on the left sidebar goes below
the bottom of my window, but there're no scrollbars.

The top is yellow with a big OSS logo.

The remainder of the screen (most of it) is grey.

I'm running Netscape 4.76 for Linux with JavaScript and Java turned
on. (Ugh)

Bill,

I think the problem is at your end, but definitely not your fault. Let me explain:

Many pages are optimized for use with IE. Maybe that's a mistake, but it's reality. I've noticed that Netscape, particularly Netscape as implemented under Linux (which I've stopped fooling with, BTW) don't render colors, etc., the same way that IE does.

For pages like this, you may have to (UGH!) readjust your monitor. It reads just fine in (UGH again!) IE.

Maybe one of their members can answer better than I. OHAUG is no longer a national club, but the local guys still meet in each others houses. All of them have PCs now, and that's where the fascination seems to be. I still do Atari in emulation, but that's about it.

But I digress. Back to SLCC. I guess that because I was OHAUG's newsletter editor up to December 1999, I was still getting newsletters from SLCC up to a couple of months ago. Then those stopped. That doesn't mean they're not meeting, but I get the impression that their membership dropped off, so meeting announcements and newsletters are no longer considered important.

I might have Bob Woolley's email address. If I do, I'll send it to you via private email.

Well,
the answer is as simple as that: atari-computer.de is gone !! Thus,
atari-computer.de/abbuc and hundreds of other pages of atari-computer.de
are also gone !! It`s a sad situation, maybe someone can rescue a few of
these lost homepages. -Andreas

> Does anyone know if SAM is able to work under SpartaDos.

Ahem,
which SAM do you mean ?? The american version, called "software added mouth" or the german version "screen aided management" ?? If you refer to the german GUI, the answer is no, it does not work under Sparta/Bewe DOS. It only likes DOS 2.x and here most of all DOS 2.5. It does not work at all with a DOS 2 uncompatible DOS version (DOS 3, DOS 4, DOS XE, Sparta, etc.) and it does not work very well with DOSses other than DOS 2.5 and formats other than Medium/Dual density.
This is because SAM once was a simple type-in listing. And at that time (1988) everyone in Germany had DOS 2.5, so it has been built around this DOS. Nowadays this seems rather awkward, but without a good programmer it cannot be changed ... -Andreas

Well,
you are talking of "software added mouth" here, don`t you ?!?
The other SAM comes on an unprotected DOS 2.5 dual-density disk...

> J-C
>
Well,
just some hundreds of new games had been released. Too many to tell them
all. Thinking of british producers and developers, like Cognito,
Zeppelin Games, Mastertronic, Fire/Silver Bird, and many more. Also some
german producers like KE-Soft (famous Lemmings-Clone, called The
Brundles), Power per Post, AMC Verlag and others. In the nineties we had
many eastern european producers, like LK Avalon, ASF, Sonix, Mirage,
etc. they produced hundreds of Jump and Run games, but also some C64
clones, like Barbarian, Operation Blood (aka Operation Wolf), etc.
etc. -Andreas

P.S.: Take a look at some A8 homepages to get in touch with these
productions !!

Well true.. and not true.. depends on the JPEG. You can look it up if you like. I know we used lossless JPEG compression in an image processing lab. This taken from:
http://www.faqs.org/faqs/jpeg-faq/part1/

...JPEG is "lossy," meaning that the decompressed image isn't quite the same as
the one you started with. (There are lossless image compression algorithms,
but JPEG achieves much greater compression than is possible with lossless
methods.) JPEG is designed to exploit known limitations of the human eye,
notably the fact that small color changes are perceived less accurately than
small changes in brightness. Thus, JPEG is intended for compressing images
that will be looked at by humans. If you plan to machine-analyze your
images, the small errors introduced by JPEG may be a problem for you, even
if they are invisible to the eye....

Cross-posted to: rec.games.vectrex,comp.sys.cbm,comp.sys.atari.8bit,comp.sys.amiga.games,rec.games.video.arcade.collecting

** PhillyClassic 2001, The East Coast Classic Gamer's Event! **
** http://www.phillyclassic.com **

** UPDATE: 01.22.2001 **

Hasbro has sent us a lot of games to be given away at the
convention! Thanks Hasbro!

Michael Roberts has donated a TON of Star Wars handheld games
for us to give away at PhillyClassic. Thanks Michael!!

** UPDATE: 01.10.2001 **

Digital Press has graciously donated MANY Digital Press 6 guides
to be given away at PhillyClassic! Thanks Joe and everyone else
at DIGITAL PRESS!

We rented another 1000sq ft room for the convention, bringing the
total up to 3000 square feet!!

More and more sponsors are contacting us EVERY DAY meaning
more chances for everyone to leave PhillyClassic 2001
with a GREAT prize!

Classic Gaming Expo and PhillyClassic have teamed up to bring
you the best gaming experience you can get on the east coast!

John Hardie and Sean Kelly are graciously donating items for us
to give away at the convention. When you hear the names Hardie and
Kelly, you know they've gotta be good!

Ticket prices are currently $6 in advance, and $7.50 at the door.
Tables to setup your goodies on are $10 per table. Tickets will be
on preorder until March 30th, 2001. Just remember, we're a
non-profit event, every cent we make on PhillyClassic goes right
back into the convention!

This year's tickets are pretty nifty! Marc has made Intellivision
carts into our tickets that hang from you neck! Really neat!

** UPDATE: 12.23.2000 **

Sponsors are pouring in, which means more chances for everyone to
walk away from the convention with a great FREE item!!

T-shirts will soon be available for pre-order. These spiffy shirts
feature the PhillyClassic logo and some classic game logos! Be sure
to put an order in as soon as they're available!

Randy Crihfield of Hozer Video Games has donated some new
Atari 2600 games to be given away! Thanks Randy!

Jeff Folejewski will be bringing MANY (as in more than 5) full-size
coin-op arcade games! All games will be set on free-play and a
tournament will be held on his Joust machine!

Good Deal Games has also chosen to donate some of their new Sega
CD games to be given away at PhillyClassic! Thanks Good Deal
Games!!

** UPDATE: 10.30.2000 **

Van Burnham, editor of Wired magazine and author of Supercade
(www.supercade.com) has confirmed she will be attending
PhillyClassic! She's a great video game buff and a wonderful
person to talk to!

Be sure to bring all your spare games and systems, we will be
holding another auction this year! Last year people who auctioned
items off made a LOT of money, and it's a good way to part out
some of the extra items you don't need!

** UPDATE: 10.15.2000 **

Chad Schell of Schell's Electronics has donated an Intellicart
to be given away as a prize at PhillyClassic!! Thanks Chad!

Tickets for PhillyClassic are now on sale!! The price for admission
is $6 for both days, and $10 per table you wish to use to setup on.
Just remember, any money taken in from the attendees is not used
as profit for any of the organizers; it's used to pay for everything
used to setup the event. In case of any spill over money it will be
used towards next years event!!

If you have any items in particular you're wanting to pick up or to
part with, be sure to e-mail Jeff Folejewski and let him know so he
can add your list to our PhillyClassic webpage!

** INITIAL POST: 9.26.2000 **

David Newman, Chuck Whitby, Marc Pallante, and Jeff Folejewski
are proud to present PhillyClassic 2001!! The first
PhillyClassic was such a success we had no choice but to do it again!
This year's event promises to be nothing but BIGGER and BETTER!

Website is now up and LIVE, complete with:
* Information/scheduled events
* Hotel accomodation info/online reservations
* Driving directions and interactive maps
* Ticket information
* How To Link to Us banners/ads available for
YOUR classic game related site!

The weekend of April 20th and 21st will be one to remember as classic
gamers unite for a weekend of hardcore gaming!

Planned events include casual trading/selling, *tournaments*,
auction, show-and-tell, a guest speaker or two, and a
general good time by all!

We have rented a 2000! sq ft conference room at the Sheraton
Suites for the event, which means enough room for a lot of
people to come and setup the pride and joy of their collections,
and even a little tradebait!

The tentative times are as follows:

Friday: 5pm - ?? -- First Day, Setup, Meet and Greet, Informal
Trading and Game Playing
Saturday: 9am - 5:00pm -- MAIN DAY

If you have any questions about the event, PLEASE e-mail:
David Newman (davidnewman@adelphia.net)
Chuck Whitby (intv-sama@worldnet.att.net)
Jeff Folejewski (adventurevision.yahoo.com)
Marc Pallante (marc@classicgamer.net)

If you plan on attending, please
purchase your tickets early and make those hotel reservations!

Thank you very much!

Bill,

thanks for the tips. this is really my first go at a website and I've got some redesigning to do I believe. I really enjoy the programming which is the why there's so much javascript. I'm considering a redesign, mainly to support the older lynx-style and frameless browsers, but was not aware of the Netscape problems. I'll take a look at the colors and make a better choice. For this 2nd version, I'm thinking of writing a simple generator for all the pages that produces versions with no javascript, possibly with no frames either... still not completely decided about the frames -- I suppose since I'm running the navigation pages through a generator it would be simple to have two sets one with frames and one without.

I do have another 4 or 5 articles just about ready to go... from Analog and Atari Interface, so stay tuned.

If I understand right, you're trying to write real atari disks from
APE, using images.
Boot from APE, MyDOS or SpartaDOS.
Have already put a .dcm file on one of your APE images (APE images
can be very large).
Run dcomm32 disk communicator 3.2.
Specify the .dcm image you have on the APE disk and your real
drive as the destination (say D2:). That's about it. If you need
to convert an image from .atr to .dcm, you can use Steve Tucker's
imagic program.
Tom Hunt also wrote an atr2disk program for the 8-bit. It only
does single density images to disk, but that's another one you could
use.

Sounds like the disk you're using or the drive, as why it reads
in spurts and pauses. It is having trouble.
As for double density, you didn't mention that it is a USD or
Archiver or some mod of a stock 1050.
Stock 1050 can't read double density, it can read the 'enhanced'
density, but not double.
These drives are gettng old. Probably nothing you can do.
Try a different disk and see if it reads good.

It's only on the carts, my copy I bought in 1981 has 'Raider' on the
cart but 'Raiders' on the documentation and the box cover.

I think it was just a typo on the first run of cart labels.

Lightspeed C was pretty good. It was an integrated development environment,
its own DOS and editor for writing programs vs "use your favorite WP" type
of stand alone compiliers.

Can't remember which one I fooled with, could have been CC65, but it
understood braces
for {
vs
for $(

Like you have to do with most Atari C compilers.

The Prosystem requires a different cable. Only about 2 parts different,
resistor and zener diode, but completely incompatible with sio2pc.

Well, that would explain it. Looking at Nick Kennedy's page, it seems
that the interface requires an external power supply and two of the
lines are opposite the sio2pc. Does anyone know of an image to disk
writting program that will work with the sio2pc cable?
I guess it may not even be possible.

TextPro or Compute!'s type in Speed Script were popular editors; even the
AtariWriter cart works if you leave out the formatting control sequences.

I would like to give it a go, please. I think S.A.M. loaded at lomem right above DOS.SYS in the area used by DUP.SYS; that means it should fit under Sparta as it normally provides larger free RAM. All we have to do is separate it out and make certain its init code updates memlo.

345. 1050 Problem II

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-13 08:15:36 UTC
From: Erwin Vicari <vicari@cybercorp.getxs.nl>
Message-ID: <93p36g$20d$1@azure.nl.gxn.net>
Source record: 39467

Hello Atarians

Since my last question about my sputering 1050, the next problem I
analyzed:

I have waited for a night with the 1050, and after that period, the 1050
can read Single Sided disks (not on the speed of a 1050).
He reads at a speed of :

a "." means no sound
a "- means a 'read beep'.

the normal 1050 reads like:
".----------.----------.-----------.----------.---------"
My 1050 reads like:
".--.--.----.-.-.-.---.-.--.--.-.-.---.-.-.----.-.-.------.-.-.-"

And also; he cannot read Double Density disks!

Thanks again!

Erwin

I think I have it on my harddrive as a seperate file. Had it as a boot
up file under sparta and would say what ever you like when booted.

see if I can dig it up.

The best assembler is MAC/65 I think but I have seen several other good
assemblers for the 800XL...
For the best C compiler you can use CC65 for 800XL it's not supported
anymore, but still very good. The only problem is you need a big ramdisk or
harddisk to use the compiler/linker with all libs...
But CC65 is also available as cross-compiler for PC. You can find it at
WWW.CC65.ORG it's still supported and you can download the latest version
there...A lot of Atari 8-bit support is added lately...

I've been told that you should ALWAYS preview your pages with Netscape
before you publish them. Not because of the old "test with all browsers,
all platforms" excuse - but because Netscape refuses to display incorrect
html - where IE will let you get away with simpler mistakes. If you've
written a problem into your file - Netscape will usually bug you about
it....

It makes sense to test with / but not use / Netscape -
Sorry - I'm a IE Convert - I've learned long ago that if
you don't mess with IE, Windows behaves :) I still use
Netscape on Linux - and it does a fine job there...

anyway - hope that helps.

There was an article in Antic magazine (I believe Dec 85 or thereabouts) on building your own. As designed you could do up to a 2764 EPROM, then the following April Antic published a small mod that allowed programming a 27128 in two 8k chunks. The drawback to this design was that it only worked on the original 800, and not on the XL or XE computers.

Some years ago somebody (I thought Bob Puff?) was supposed to be working on a burner for the XL/XE that plugged into the PBI, but I don't know whatever came of that project...

Could be one of five things.
1. The drive is out of alignment. To fix this requires a Dymek
alignment disk and an oscilloscope.
2. The head is dirty. A little alcohol on a Q-Tip will do, just try
not to get any alcohol on the pressure pad, or you will have to sit and
wait for it to dry before you can use a disk.
3. The pressure pad itself could be worn out. I don't know of any
replecement parts, though you may find a vendor if you look hard enough.
4. The pressure pad tension could be loose. After it sits for a number
of years without being used, the spring will start to "set". You should
be able to pop it out and re-bend it, but don't overdo it.
5. The head could be worn out. Nothing I know of here except to
replace the mechanism.

Hope this helps.

What problem are you having? On the BB version I had the disadvantage
of not having a BB available to properly debug the handler, and had to
rely on a friend to test it out for me. If I can get hold of a BB with
docs, I may be able to see firsthand what I'm doing wrong.

> And also; he cannot read Double Density disks!

Definately the time to try formating a new disk. Here's the haps; as others
have said; you could have an alignment problem. But the alignment problem
will only exist when you are using disks created in another drive, unless
that drive happens to be misaligned exactly like yours of course.

If it formats a disk and reads it w/o trouble, the problem is alignment
relative to the other disks.

If it formats a disk and fails to read it or fails to format at all, then it
could be something else like a dirty head or slipping belt or any one of a
number of things..

You could be getting some bit rot on the older disks.

Maybe just me, but I would only fool with alignment if it failed to read
commercial disks that worked in another 1050. If your failing one is a
little bit left of center and the one that works is a little bit right of
center, they may both be able to read commercial disks but not each others.

I think any programmer.. new or used would do. Just has to program 2764 and 27128's. Of course I am no expert on every cartridge out there.. maybe someone knows all the different varieties. I think most any programmer today would cover those EPROMS.

I did look into burning the OS PROMS.. that is a bit trickier. I never did it, but it would require an "adapter interface" Look for my post on the "Atari 400 HW Problem", melee5 gave me some good information.

Neeham Electronics sells some good ones for the IBM at under $150. I've had their PB-10<?> for about 10 years and it has never missed a beat. It does eproms up to 1 meg IIRC.

Hanging out in comp.arch.embedded, it seems like I am not the only Needham fan anyway. They don't offer quite as big a list as some of the other manufacturers for devices they work with, but the ones they leave out are so esoteric I haven't missed them.

Another good place to look for generic programmers is JDR's outlet store. You can get a reasonably priced one from their www.jdr.com page, but if you happen to be passing through Campbell Calif they usually have one or two returned but tested good programmers for ~$50. Fairly good specs, ZIF socket, eproms to 512kbit, but I have never used one.

Really at this stage of my life, I probably wouldn't go with an Atari based programmer again. I had a Thompson Proburner I paid $150 for and it never worked as advertized. I loaned it out to a hospital and it came back broke. That ended up being one of the best things that could have happened to me as I bought the Needham programmer to replace it. Saved me dozens of hours of frustration.

I had one called - "Preliminary Monty 16K" This game was awesome! I got it as a hack/pirated version from a friend. I am not even sure who wrote it. I assumed it was Activision. I wanted to buy the real game, but never ever saw it. I got it back when I was in college in the mid Eighties, and didn't have much money anyway ;). I remember there is a maze structure to the game. You can map it, and there are "secret" rooms if I remember right. And once you get through the end, there is a "Jewel Room" where you get bonus points. Once you get the jewels you start a second level... I still have a playable version on my disk.

Right, and Steve Tucker has the one for Prosystem on his web pages. I think
Clarence Dyson has both types up at.

http://www.redshift.com/~cdyson/atari.html

I've never used Nick's version or built one of his cables. I did put
together a number of Prosytems cables for stocking stuffers and testing.
There are a few things with the Prosytem cable I would change, the zener
connections and add that a regular 1489 seems to work just fine.
> Does anyone know of an image to disk
> writting program that will work with the sio2pc cable?
> I guess it may not even be possible.

What Russ said: If you have a real Atari computer, you don't need one. Just
have the real Atari 1050 and sio2pc cable both up and running. Use the DOS
menu option to duplicate disks. Copy from the ATR on the PC to the real
drive.

Close, it was Parker Brothers. I don't remember ever getting a bad game from
Parker Brothers, they also had games like Frogger.

I think this was the first game I ever had to hack. I upgraded my only 1050
to USD and it failed to load/get past copy protection after that. Ended up
with a ~14k sloppy dump that worked. But yes, great game, I spent literally
hundreds of hours playing it.

Sure that is the simplest for a NEW file or completely replacing or retyping
the old one. It might even work satisfactorily with the /A switch for appending
a line or so. Its utility is very limited for any type of 'real' editing in an
existing document.

365. XEGS doesn't cold reset right.

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-13 19:47:49 UTC
From: Tom Rosso <audiophilia@qwest.net>
Message-ID: <kh286.998$D01.306701@news.uswest.net>
Source record: 39489

I've been having trouble with my XEGS. When I first turn it on with a disk in the drive, it boots up okay. Then, if I want to play a different game, I switch off the machine, swap disks, and turn it back on, but nothing happens. I'll either get a black screen or I'll get a blue screen with a cursor in the corner, but everything is frozen. I have to leave the machine off for 30 seconds or so after I swap disks or else it won't boot up. I'm just wondering if anyone else has had this type of problem. It doesn't happen with my 800XL. Thanks.
-Tom

I've never stopped supporting it. Check out-

http://members.nbci.com/cc65foratari/

It has the cross compiler version available for downloading, plus some
libraries and source code. It is completly compatable with the J.R.
Dunning version and libraries, and includes his cool multi-pass executables
that make the forward referencing of symbols a snap without the use of alot
of header files or declarations.

Check out-
ftp://ftp.spudster.org/pub/Atari/CTH/Cth_Shareware/readit.sfx

It's a SelF eXtracting file for Sparta, so just copy it to it's own
directory and run it and it will install itself. If I remember correctly,
you just put what you want it to read in to a text file, then type
something like-

readit myfile.txt

... and it speaks whatever is in the file.

If you've decided not to make use of the reserve, just add the reserve
price to the description. That'll stop people from mailing you about it.

Frames are a legacy feature. Netscape thought they were a good idea
about five years, and now the browser makers are stuck with them for a
while.

As a general tip, it's best to run pages through HTML and CSS validation
(see http://validator.w3.org/) and test them on various browsers to
catch the common problems. Unfortunately, that doesn't always catch the
differences between, say, NN4 on Linux vs. NN4 on Windows. IE5 on the
Mac is especially likely to render things differently (it uses a newer
rendering engine than IE5.5 on the PC).

That is normal. All the XE line was like this, as were some of the
XL's, depending on where they were made.

This phenomenon is not limited to Atari. A great many
microprocessor-based gadgets out there do it as well. I think it has
something to do with the RAM chips needing the time to properly bleed
off any residual data.

It's better to use a real validator for validation. I'm told that iCab displays an icon indicating whether the web page you're viewing is correct or not. Mozilla's got something similar on the way (a "This page contains errors and may not be rendered as intended." sort of thing).

> It makes sense to test with / but not use / Netscape -
> Sorry - I'm a IE Convert - I've learned long ago that if
> you don't mess with IE, Windows behaves :) I still use
> Netscape on Linux - and it does a fine job there...

Or just upgrade your OS. NT4 hasn't given me any problems in years. I use Mozilla for my normal browsing, but testing with NN4 and IE is important because of the number of things they don't support or screw up badly. NN4 is a nightmare for complicated CSS layouts. The sooner it dies, the better.

Could you put it on an archive or a web site somewhere? When I hacked the orginal to run out of cart I did a pretty sloppy job, mostly just relocated it to where it wanted to go and I am not even sure if I used the mode 3<?> character set. I would like to think about giving it another shot at doing it right.

There was also a problem with quiting the program IIRC, you had to cycle power since they even trapped reset. I think the modern convention would be to exit to DOS.

To be a completist, (or pummeling a deceased equine) I checked with my Mac,
and IE 5.0 looks fine, but Netscape 4.7 chokes bigtime. The colors are
correct, but that's about it. It doesn't complete rendering at all. Must be
using some features that Mac Netscape 4.7 doesn't support.
I would bring up Opera on my PC but I think we may be starting to make a
dent in the butterfly population here.

http://www.xtronics.com/memory/EPROM.htm $129

Great unit even does 2532 chips

Needham did discontinue the PB-10 recently but you should still be able to get one (they still
make the ad-on adapters for it)

Both units are great for the price. The PB-10 you need an ISA slot free on your computer while
the Pocket Programmer uses the printer port on your computer. Works great with old 386 laptops

that now might not have a use.

They both do most the same chips the pocket programmer does a few more but you will most likely
never burn them anyway

don't be fooled my the device list on needhams site, they will list a chip 20 times if 20 different companies make it while xtronics will only list it once.

both companies have been around forever I know xtronics has sold the pocket programmer for the
same price for over 10 years

www.needhams.com ----------down right now but was up yesterday

Yes. Mostly all carts, tapes and disks run fine on all machines. A few exceptions it is, but mostly yes.

Older games might need a translator to run on XL/XE's. Demos and such from Europe might not work on US machines (50/60 VBL timing problems)

383. *** SIO2PC on 800XLDJ questions....

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-14 10:36:26 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <0000.3a61e229@fmlynet.org>
Source record: 39426

FamilyNet HQ: Telnet:\\www.family-bbs.net

Greetings, I have a few questions about the SIO2PC under the Atari ST program 800XLDJ. What I am planning on doing is getting this program to run under the Atari ST similator "MagicMac". If I can get this working, then Macintosh users will FINALLY have some solution to create virtual drives for their Atari8 computer.

If this doesn't ever work, I'll try APE under SoftPC.

My questions for everyone out there...

1) Have you ever used 800XLDJ? (800XLDJ is basically the ST's answer to the APE interface, providing 8 virtual drives for a true Atari8 computer to access the drives off the ST's hard drive via a SIO2PC (or "SIO2ST" as we like to call it) cable.)
[If you have never used this program, proceed no further, thanks for you time. If you have, please continue on the questions...]

2) What Atari 16/32 bit system did you run this on?

3) What system (Magic, Mint, Linux, regular TOS, etc...) was running on your 16/32 bit system? (Would love to hear from Magic users on this in particular)

4) and other screen accelerators (NVDI, Warp9, Geneva, etc) was running on this system?

5) (Optional) if you have MagicMac or MagicPC and ran this program, what kind of setup did you have?

Many thanks in advance!

There's more than just Lynx.There's also "Links" and W3M and Emacs/W3,just to
name other Unix-based text viewers.And there are graphical HTML viewers like
Arachne and WebSpyder for IBM computers.

And whether someone is using text or graphics,why would anyone want frames at
all?

What do you mean by "optimized"???

>> : http://www.halcyon.com/danver/atari

Well,the third FRAME doesn't actually have a URL.Just a blank "SRC"
attribute.Lynx just ignores the phantom frame but Links and Emacs/W3 treat it
as a link to itself (the HTML file containing the FRAMESET) and hence you get
infinite regressing FRAMEs.W3M treats it as a link to the root directory of the
host so it avoids infinite regression.But W3M shows some of the JavaScript.Of
course this is all meaningless since there doesn't seem to be any actual LINKS
to follow so the whole place esentially looks empty.

>Why don't you want the Atari community to support itself by using FTE or
>SpartaDOS products?

Well,for one thing,SpartaDOS doesn't indicate the EOF (End-Of-File) when reading a file in update (read+write) mode.Instead you just get a endless stream of zeros (hearts) and for every zero read a zero is appended to the file so eventually the file fills up the entire disk with NUL/heart characters and you get a "disk full" error.
("Atari Rogue" is what brought this to my attention)
And there's also the incompatibility of SpartaDOS's (and DOS 3's) NOTE and POINT XIO commands.
(which are used to "FF/REW" through files)

There's also the problem with sub-directory filenames having a extension.Try making a directory called "FILENAME.EXT" and then CWD'ing into it and see what it says for the current directory.
(using "?DIR",I think)

I don't think there is any hardware for the Atari that supports 14400.
(which is what you mean."14.4k" would be 14745.6)
But you should use the MODEM at 19200 anyway.I know that USR MODEMs won't even
respond to commands at speeds like 28800 and 14400 even though IBMs support
them.

Huh? I don't understand what you're saying.How would a IBM run a Atari ML
(programme) file???
Or is this some new thing where you can make a IBM file out of a Atari file so
that,when run,the emulator is automaticly ran and given said Atari programme to
emulate/run?
Otherwise this makes no sense.If you wrote a Atari programme to a IBM file,IBM
DOS would simply crash since it doesn't check the file to see if it's valid
like Atari DOS does.

>If the cart contains cart specific logic e.g.write to the cart memory
>area, can the code be disassebled and no-op-ed ? I guess I'm asking
>if anyone has attempted to do this.

Well some cartridges try to alter themselves to see if they are really running
from ROM.In fact,the Atari monitor (OS) tries to change a special memory
location to see if there's a cartridge to run and/or initialize.
(two locations,actually,since there are two cartridge slots)

>It seems to me there is a constant desire for 8 bit carts (as shown by
>the market traffic on ebay) and this would be a good way to distribute
>cart code (if permitted by ownership).

I think most (if not all) catridge games have been altered to work from a
disk,file or tape.

>> might have come with the sparta construction set.

There were two versions.The only difference was that 2.3c gave control over to
the cartridge (like normal DOS) where as 2.3d took you right to the CP.
(CP=Command Processor)
And,as for LOGOMENU.SYS,it requires DOS (SpartaDOS,presumably) to be loaded so
it's not the best thing to use since some games might not run with DOS loaded.
(or,more to the point,they might need to load up in the same place as DOS)
There are better loaders that access the disk drive directly (or through the
SIO routines) that support UltraSpeed and such and are their own DOS (FMS) for
the purpose of loading a file.They take up less RAM so they work with more
programmes.Then again,I always just used MyDOS's DUP.SYS to load games that
worked with (or required) DOS.

>> Also I pretty much use sparta 3.2g (this is a shareware version no?)... it
>> works great as far as I can tell! Never had a problem so far. Is there
>> another version you recommend? I know that Video61 sells the stupid cart
>> version that you have to yank out. I'd never buy that.

You should use 3.2f.
3.2g changed some of the commands and it won't let you do something as simple
as "COPY E: FILE.TXT".Of course neither version supports the concept of a
default drive (to be used when the user just specifies something like
"D:FILE.EXT") so I prefer MyDOS.

>Great DOS, my favorite, in any flavor.

What's 3.2d and 3.33a? I've only ever seen 3.2e and f and g.
And f is the same as e.But g had some "features" added like re-named commands (say goodbye to your batch files) and there's problems copying to a disk file from another device (like E:).
(which was my favourite way of creating & updating BAT files)

I don't think that there's anything wrong with pulling a cartridge out.It's
puting one in that's supossed to be a problem.

You can also do something like "COPY E: STARTUP.BAT/A" to append to a file.
What I used to do with SpartaDOS X was TYPE the file out and then do a
"COPY CON: AUTOEXEC.BAT"
(and people wonder why I hated SDX worse than normal SpartaDOS)
and then move the cursor back up to the lines of the file that TYPE just
printed out and then simple press RETURN on each line;editing as I went.I see
no reason why this wouldn't work with normal SpartaDOS and the E: (or any CIO)
device.

>change. Transmetta maybe close to this..

Actually,if you use a single routine,then only that routine is copied
("linked") into the resulting file.Of course things like printf() are a little
too overly complex for printing a simple error message.
(better to use write())
And in modern Unix-like systems,only the pages (4k blocks,usually) that are
actually needed are read into memory.And then only once no matter how many
programmes are using the same routine/library as the seperate programmes
"share" the memory between them.

Just look at games like DOOM and Hexen on the Sega Saturn and then look at
Lobotomy's Quake,Duke Nukem' 3D and Powerslave to see the difference assembly
and a good knowledge of the hardware can make.I've heard that without
assembly,it is impossible to TRULY take advantage of the twin processors in the
Saturn.
(which are refered to as "RISC" CPUs)
The same thing happened to the Atari VCS and HCS,though all games are written
in assembly for the VCS.And,of course,game systems are a area where you have to
conserve memory,as well as cycles.

>and I accept that. Evidently some people haven't.

I remember the Atari programmers saying that they picked a 6502 for the Lynx instead of a 68000 CPU because 68000 programmes take up more room than 6502 ones.From what I've read about the 68000,this seems likely.I remember something about how all instructions are the same length.There is also the evil that is the AES.I prefered to avoid the ST's equivilant to MS-Windows altogether and stay in GEMDOS (which is actually WORSE then IBM DOS) and BIOS (one byte PUTs/GETs,anyone!),myself.
(why is the OS called "BIOS"? That's what the OS is called on CP/M machines)
And as far as IBM goes,I've seen some SMALL demos from europe.
(FTP to ftp.hornet.org @ /pub/demos/)
I've even seen a demo change the palette of a text screen during horizontal blanks.This must be CPU-intensive as the IBM doesn't provide line interupts like most other computers so the demo would have to watch a register CONSTANTLY to do this.

Well lots of memory is nice for editing big files and such.But it just seems to cause programmes to baloon in size.

Still down this morning as of 7:30 AM Sunday California time. I hope it doesn't mean anything bad. I've talked with him over the phone and he seems like a really great guy.
> www.xtronics.com

I went to their site and checked them out. Needham's came out with a parallel printer port device too, the EMP-20 IIRC. I can't recall the price off hand, I think it was a bit more then $129.

I kind of like the looks Transtronics devices since they look like they do a pretty wide range of adapters, everything from PICs to AVR 8051 clones and Atmel RISC AT90s.

For most of the stuff we do, all of the devices <EMP-10, 20, and I-PP-1> are probably overkill.

I'm not sure if I get exactly what he wants to do either, but I see the potiential.

Let's say you have the emulator and a couple of hundred cart files that were made into disk files, all that you have legally of course. All you would have to do is either load them /n<?> such that they don't execute and save a clean image + 6 byte header or go to the OMNIMON monitor and write them out to a work disk.

Stripping off the 6 byte header or getting a clean file from the work disk to create a binary image is trivial.

Clarence Dyson has a good web page up with the best contruction details I
have seen.
http://www.redshift.com/~cdyson/atari.html

There are only a few people that sell them, Edward posted a link to one.
Somewhere around $20-$30 seems to be the going price for them. Building it
yourself will cost ~$8 if you put it in a nice box so the prices aren't out
of line.

Maybe, I would have used it to patch the directory filename routines for MyDOS
4.50 or .534. Luckily I had Compute!'s manual and made do with a sector editor.

Hi Gang,

I am looking to purchase a working 800XL with the power supply. Please let me know if you have one for sale. Does not need to have the paperwork, or box or anything, just the 'puter and the power supply. Oh, and a spare SIO cable would come in handy.

Please let me know!

Thanks

Dan

407. Atari game copier (info)

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-14 21:29:33 UTC
From: Retronics <jos@grephx.nl>
Message-ID: <979507791.922.0.pluto.c3adee40@news.demon.nl>
Source record: 39430

Hallo,

I get loads of emails with questions about the game copier.

How does it work?:
Here is a picture direct from the box, with some info about "how to
operate":
http://www.0900bellen.nl/ebay/atari.jpg

Do I need a power supply?:
The copier will work with the Atari 2600 power supply. So you don not need
an additional
power supply.

Are you selling two copiers in this auction:
I sell two MIB copiers (2 auctions) on Ebay:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=540108511
and
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=540109902

Is there a difference between the 2 copiers?:
They are identical

I hope this will help.
Jos.

408. Value of 8-bit hardware?

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-14 22:23:33 UTC
From: snarfblat@my-deja.com
Message-ID: <93t8sv$2nc$1@nnrp1.deja.com>
Source record: 39431

I have the following 8-bit hardware sitting here collecting dust. I've had it for probably 7-8 years, and as much as I want to keep it, I just can't justify it. I'd rather somebody else get use out of it.

I'm wondering what it's worth? I'll probably eBay it, but I haven't been able to find any current values on the stuff as a place to start.

Atari XEGS in box with all accessories and book (no cartridge)
Atari 1200XL, stock w/manual and PS
Atari 800XL, stock with the best of the good keyboards, w/PS
Atari 800XL, w/Rambo 256k and the other of the good keyboards, w/PS
Atari 1050, stock w/PS, SIO cable and original box in so-so shape
Atari 1050, US Doubler, w/PS and SIO cable
Atari 1050, Happy 1050, w/PS, SIO cable, and Happy/Archiver software
Atari XF551, stock w/PS and SIO cable

Commodore 1802 monitor with video cable
ICD 256k MIO w/PS and printer cable

ApeFace printer interface
Supra Micro-Print printer interface

Basic XE cartridge w/manual and extensions disk
Action! cartridge w/manual and Action! Toolkit and Runtime disks
Mac/65 catridge w/manual

If there's something here you just HAVE to have, then email me.

Thanks!

Rob

Well,
the answer is easy: Montezuma with title+music (32k) is the unfinished
prototype !! The other Montezuma (without title or music) is the
shortened 16k commercial version. It was released with the 16k computers
(Atari 600XL) in mind...
-Andreas

P.S.: Greetings to Lance - I want the 16k version on a cart !!

You should read the question before the answer...
But well, Lance (of Video 61) really sells a few carts which have to be
put in first - and about 2-3 seconds later they have to be plugged off
again. Those carts are: Sparta Dos 3.3c, MyDOS 4.6 and the Translator
cart. Their programs will only initialize fully, if you plug off the
cart again !! -Andreas

As I now have a spare 400 and my (almost) 3-year-old INSISTS on banging on the keys like her daddy, I thought it might be nice to set her up on the little TV in her bedroom. I don't want to put a disk drive in this experiment, and my 410 is way too unreliable (and slow) to be of use to anyone her age.

Can anyone recommend any good carts for a really young kid? I dug through my pile of carts, but couldn't find anything really suitable. Maybe that's because I was 9 when I got MY 400, so I was way too mature for the kind of stuff I'm looking for now. :)

421. Atari to PC transfer-- need Xformer cable

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-15 18:56:21 UTC
From: Brian Siano <bsiano@bellatlantic.net>
Message-ID: <3A634695.B9B1A19C@bellatlantic.net>
Source record: 39443

I've got a number of old Atari 8-bit disks, and I'd love to be able to transfer a lot
of my old word processing (Atariwriter and ASCII) files to my PC. I recall hearing about
some method for hitching an 810 disk drive to my PC, but it required using a special
cable.

Is there some place where I can buy an X-former cable? I'm no good at electronic stuff, so I can't make it by myself. Please reply by Email.

I think you need to be an IEEE member to program too, that is probably the conclusion of the article.

I thought it may be interesting to read the article myself, so I did a search for "Why Johnny Can't Program". Turns out Johnny can't read, decode, add, walk to school, pretty much everything you could imagine. I think I went to high school with Johnny.<sic>

Needless to say, I could not find the article. Figure anyone that uses such a tired title for an article i.e. Johnny Can't <anything> probably doesn't have anything original to add.

The reasons for the current situation are legion. In the USA, 70% of the college students admit to cheating to get through college. Most people choose their career based on job prospects when they get out of college vs and apptitude for a given profession.

Education is valuble, but in its current form it can not distinguish between a talented person in a given field and a talented student. It is like trying to associate people that score high on their driving test with grand prix drivers. They skills are not mutually exclusive but exist as set and subset.

Just like we have bad garage bands because the Rolling Stones make $40 million a year, we have bad programmers because 'someone' heard they make $120k a year and cheated their way through college to get there. I doubt if the situation will ever change and offer no solutions either.

Message-ID: <slrn966rsn.gnf.pjsmith@worf.netins.net>
Source record: 39446

Yep, its yet another call for help with SIO2PC.

I have a 130XE connected to an old 486/66 PC running plain MS-DOS 6. I've installed the SIO2PC software, V4.19 and everything works ok except its extremely slow and sporadic. When booting, it beeps right along, then suddenly stalls, beeps some more and then stalls again, etc... Does this on all disk operations.

Is this a symptom of bad timing settings? I know the cable is fine because I used it on a Win95 box with no problems.

Thanks,

Phil

425. SPARTA DOS 3.3A 3.3B 3.3C

Have carts, but don't know which to recommend. Spinnaker or CBS titles are probably good. I think I have Astro-Grover, Big Bird's Special Delivery, Ernie's Magic Shapes, Letter-Go-Round from CBS and Facemaker from Spinnaker. Maybe look for a review on the Antic site? Let me know and I'll dig them out and see what shape they are in.

Sounds like a hardware conflict somewhere. 95 can sorta do a good job of assigning resources to daughtercards to keep them from fighting one another, unfortunately dos doesn't have that capability. My recomendations...

Go into Bios and disable everything except the primary IDE and serial port 1. Remove any unnecisary components (i.e. sound cards?) from the system.

Reboot and try again.

I think the same thing carries over to the current certification craze for computer professionals.

Most of the guys who've been in it for a while _AND_ are certified tell me that their experience on the job is worth a whole lot more than all the certification papers they can hang on a wall or refer to in a resume.

I have to agree. For many years I've see people come into teaching. Some have fantastic instincts. Some have classroom-related backgrounds other than teaching. Most have only a degree with no idea of what life in a classroom is really like. Time and experience are the only things that will sort them out.

I've been told that I can go into a computer store, buy a study kit for A+ Certification, take the test and probably pass the first time around. I've also been told that the certificate is no more than a foot in the door, and that the really good jobs will only come after several solid years of work. (Of course I have no intentions of doing this!)

For all I know it may be the same in programming.

I see some dispute here.
Very interesting.
Lance, you mention you and Bob Klass contracted for 3.3c.
It would be interesting to know who you contracted with, FTe, or
someone working for FTe?
And what you contracted for. Evidently you and Bob K. paid
someone something for 3.3, so it would work better for BBS Pro.
I own a legitimate copy of 3.2d and the book and tools. 3.2d was
the last that ICD sold I think. Someone worked on 3.2 to make
the 'g' version, which FTe made shareware. Was whoever did
'g' in possession of 3.2d source?
Ken mentions disassembly of 'g', which means he didn't have source
going back to ICD. I wonder if FTe ever got the source to
SpartaDOS, or if 3.2g is also a disassembly (hacked, I guess).
Someone has put work into SpartaDOS to make the 3.3 versions.
Perhaps the 3.3 versions came from Ken Ames and his friend,
and then FTe sold their work, unbeknownst to them, to K-Products
and Lance Ringquist.
The permutations here boggle my mind.

If you do this it's at your own risk. But I seem to remember that you could
wire up your own reset switch to pin 40 of the 6502. Just ground that pin
with a momentary on button and it should work fine. If you like soldering
in your computer that is.

Well,

A: I can't do it myself as I haven't got a disk drive or any idea of the differences between an ATR and a CAS file otherwise I'd convert them myself.

B: Yes, I love the old hardware - even the cassette recorder. An emulator on a monitor just isn't the same as an Atari 400 going through a dodgy Ferguson Videostar.

C: We only found three games that couldn't live on cassette or disk (maybe we had better transfer software then) apart from sequential access ones like omnitrends universe etc.

D: I need to do something with all these 1970s EMI Soundhot tapes. :o)

446. 'Dead' Atari 1050

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-16 14:34:14 UTC
From: Geoff McHugh <mcpuffin@forty-seven.demon.co.uk>
Message-ID: <941m56lrm1@nnrp1.deja.com>
Source record: 39368

I recently decided to dust off some of my old Atari kit for old times sake, and also to see if I could rescue some of my 5.25" floppies using Ape/Pro before the contents were lost forever.

Unfortunately, my 1050 seems to have died (along with one of my 130XEs!)

It worked fine a year or two ago when I last suffered from a case of nostalgia and I made a Pro cable up but then got sidetracked and packed it all away again.

When the 1050 is switched on, the power LED loghts, but the drive mechanism does not respond at all, no drive LED and no familiar grinding noise that I recall fondly.

I connected the Pro cable to the PC and 1050, ran up the demo of Pro'98, and tried interrogating the drive. It correctly saw that it was a 1050 US Doubler enhanced drive, capable of Double Density, but reported 'Drive Error!' almost everywhere else.

I tried leaving the drive on for a while as I read somewhere here that it may cure the problem, but I noticed the heatsink in the drive getting very warm, and the PSU got very very hot. (the heat even began to spread up the power cable from the back of the 1050) Eventually, the PSU gave up (I first thought the fuse in the plug had blown, but I now think the PSU is fried, as replacing the plug fuse didn't help.)

Using another, older 400/800 PSU the 1050 still responds to Pro'98, but the drive mechanism is still dead. I tried removing all the socketed ICs in the drive and cleaning the pins slightly in case there was some corrosion, but this made no difference.

Is there anything that might be a common cause for this, or should I try to find a second hand drive to replace it. I would like to be able to 'rescue' the contents of my disks.

Also, when I was trying Pro'98, I gave Ap'98 a whirl too, but it locks up once the shareware delay finishes, so it doesn't seem to work on my PC, has anyone else come across this? I'll post more details later, I haven't really had much time to study it closely, what with having bits of 1050's and 130XEs spread about the place for the last few days!!

Just while I'm on my mad nostalgia trip, does anyone remember James Bastable and The Ark, or The City BBS in the UK back in the 80s? I spent my first few online years there, keeping the phone company rich and my parents poor :)

Wahey, I had one of them :-)

As did Silica shop (a haunt of mine in those days)

As for the emulators, well whilst its true they don't have the same
hands on feel I do think they offer certain extra's and offer damn
good emulation these days..

<cries of no they don't ignored> :-)

>C: We only found three games that couldn't live on cassette or disk (maybe we

Oh yes, lots of stuff could live on cas BUT they were ripped to hell
in most cases (I know I ripped the odd one or 3), saying that tho
there was a hell of a lot that lived on cas and were bloody good
games.

>D: I need to do something with all these 1970s EMI Soundhot tapes. :o)
>
LOL...you are an old 'un like myself :-)

Fraid I can't help on the tapes as I don't have a cassette these days,
if you don't mind building an APE lead it at least allows you to meet
half way. You could load the atr's from the PC direct onto the Atari
and enjoy them on the Ferg :-)

1050s run hot, so hot they actually break solder contacts from thermal
cycling, but no way should they run that hot.

Sounds like it is either the voltage doubling circuit <in the area between
the 3 large caps at the back of the board> or a fried 7812 regulator. There
are two regulators on the heat sink, 7805 and 7812, I would think about
replacing the 7812 and flow new solder onto all the power diodes on the
board. It is possible that one of the diodes fried, they freeze on in a dead
short when this happens and that will cause everything to over heat.

That pretty much sums it up. You may want to test the diodes before you do
anything else. They are the cheapest and easiest thing to replace and you
may get lucky.

> What eprom do I use 27c128, 27c256, or 27c256?

You can either use two 27128's or one 27256. CMOS or standard, doesn't
matter.
>
> what pins do I run the switch from
>
> do I use a double size of normal os chips and switch from high and low on
> one chip or do I stack two chips and run the switch to the power of each
> chip.

The double sized ones are the easiest to use IMO. All you do is bend OUT pin
27 of the 27256, have a two position switch with the center tap going to the
highest address line of the 27256, address A14. The other two sides of the
switch you run to 5V and ground, these can be found all over the board or on
pins 14 for ground and 28 for 5V of the OS EPROM socket.

I don't have my 800XL schematic handy, I think 65XE ~= 800XL. If you
piggyback 16k ROMs it is a bit of a mess. Solder gobs everywhere, hard to
plug the thing back in, that kind of stuff. I think you just bend OUT pin 20
on BOTH chips and wire them to both sides of the same type of switch as in
the 27256 example. The center tap of this switch in this case goes to the
socket hole/trace where pin 20 used to go.

You could do the same thing with pin 22 since pin 22 and 20 are tied
together on an XL and will both serve to switch the OS.
> My goal is to be able to play all (or most) 8-bit atari games. I would
> like to be able to play the 400/800 only game on my 65xe and 800xl

I think a triple OS, Omnimon, Omniview, and 800XL, in my system has been
able to run everything I tossed at it. Ominmon is real close to running
everything but a few carts like GORF, Omniview runs everything old including
GORF, 800XL runs the EA stuff that checks for modified OS. There are also
games that check for RAM in the $C000 region which present some problems
with software based OS like Fixxl.

Definitely a good advice. These diodes died here in one of my drives, they
can't take all the current for a long time and are IMHO under-dimensioned for
their purpose. I would especially look for the two diodes between the
three big capacitors in the voltage doubler circuit and would replace them
by 5A types. IIRC, the original drive came with 1A diodes here but they are
a bit too week.

So long,
Thomas

I would certainly differ with you on this point of you owning
SpartaDOS 3.3a, b, and c as I was the person to originally disassemble
3.2g which Mike Hohman put out as shareware. I commented as much as I
could then contacted a freind and he took the work I did and added the
enhancements to make the 3.3 versions. If anyone owns these it would
certainly be him and myself. I also have the sources of these things
sitting on my drive right from the original 3.2g disassembly.

Whoops!!! Forgot one other biggie. I have had one of the large caps on the back of the board go out. Only once in several dozen drives I have repaired, but that would produce the same symptoms.

If it is a cap, it will probably be kind of puffy. The fluid inside them leaks out, but it looks like Atari put some glue on the bottoms of the caps as part of their manufacturing process so you have to be able to tell the difference. Go with puffy being bad if you see that.

Thanks for the advice, I think you have hit the nail on the head...

For a start, I now remember leaving the drive in for repair (probably 10 or more years ago, so can't remember the exact details of the fault) and the two diodes (CR15 & CR16) between the 3 big caps seem to have been replaced (they aren't as 'neat' as the others. They are on part of the board where the most heat seems to be generated, and CR15 looks slightly melted around the edges. Also, the heatsink heats up quickest around the 7812.

Is there any simple way to test the diodes, e.g. with a multimeter, say, without having to replace them completely? You wouldn't happen to know what diodes to ask for to replace them? Thomas recommended 5A types, but I'd hate to buy the wrong sort of diode and fry the house along with the 1050!! :) (I'm more of a software type, but I can handle a soldering iron ok!)

I will try to replace the diodes and the 7812 and see how that works, I have nothing to lose as things stand :)

Thanks again for your help, I wouldn't have had the first idea where to start looking without it.

Not sure exactly how they did the voltage doubling circuit with them, but you should be able to measure resistance from one side of the diode to the other. If it is zero, it is blown or the cap like I said in another post has shorted out.

Of course if the cap has shorted, you will be lucky if anything else survived. When they go bad, they have a tendancy to act like a dead short to ground and burn everything else around them out. The weak power supplies Atari used 31 VA, may have saved you.

As far as replacement diodes, just about anything around 3 amps should be good. I even replaced the diodes in one drive with some 3 amp germanium diodes from Radio Shack, seemed to work fine.

465. Wargames cart image. Not Coleco.

I am looking for a cartridge image of a game called "Wargames" from
Thorn-Emi. It is not the one from Coleco (i think) that I have found and
seems to be prolific among the popular 8bit sites. Anybody know what I
am on about?

Thanks,

When my CR17 went out and blew the fuse in the power brick, I detected the bad diode by measuring resistance in each direction across them with a VOM; about the same = bad. High - low probably OK. I replaced with 3 amp RS #276-1141; still crankin' almost a year.

There's nothing like too much information at the end of the night to
confuse me :-)
(it's 1:30am and I should really have turned in a long time ago if I'm
going to make it to work tomorrow!!)

I checked all the diodes in the vicinity of the big caps with a
multimeter (in each direction), and they all seem to be in the high-low
category!

None of the caps look 'puffy' like Rick described earlier, does that
mean my first step should be replacing the 7812? Could it be the sole
cause of the problem? Is there a simple way to test if the 7812 is
fried before replacing it?

Thanks again, I'll get my head round this soon, honest ;-)

Any others?

469. Collector's List

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-17 04:21:30 UTC
From: hughfalk@mindspring.com
Message-ID: <9436k4$254$1@nnrp1.deja.com>
Source record: 39392
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.amiga.games,comp.sys.ti

To all computer game collectors,

In order to build and even larger community around classic computer gaming,
GOTCHA (Gaming Obsession Throughout Computer History) is adding an official
collector's list to its site. This will just be a simple table of people
who collect computer games, their contact info and what platforms they
collect (Atari, Apple, TRS-80, Commodore, etc.) It is similar in scope to
the list that Digital Press hosts; however, Digital Press's list doesn't
track computer games (beyond Atari 8-bit carts), and GOTCHA won't track
console games. If you collect computer games, please take a minute to fill
out this form:

http://www.emuclassics.com/gotcha/collector's_list.htm

You'll then be added to the list, which will be on display at GOTCHA
(http://www.emuclassics.com/gotcha/). You may find some collectors local to
you. Once I get a few names, I'll post the initial list. Then it will be
updated regularly. Please pass this message on to whomever you think might
be interested.

Best regards,
Hugh Falk

Good idea to check it right where it is. The center leg and the tab are the
ground. Let's say you are looking at the LM7812 printed on the front. Legs
will be:

[input] [ground] [output]

Input should be at least 14V and the output should be within .6V of 12V

476. Help: BASIC memory problems on Atari400/800

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-17 10:23:56 UTC
From: Daffy Duck <Daffy.Duck@hotmail.com>
Message-ID: <Z29lOl1dbm82Zkz6A9NVFX=w1fWw@4ax.com>
Source record: 39248

Hello - You're my only hope...

I'm after a bit of help with Atari BASIC on the Atari400/800
machines.
Back in the early 80s I typed in a game for the Atari out of a
British magazine, a sort of graphical adventure game in the style of
Gauntlet.
I recently tried to get it to work in an emulator, both
Xformer and Atari800win, and the same problem occurs on both.

All of the sprites used are just a custom character set, and
these appear to be corrupted by the time the game starts.

I figure it must be a memory problem as when I cut a load of
the code out, half of the rooms work perfectly, with the characters
looking correct. But when all the rooms are defined in the BASIC code
the custom character set is corrupted.

I have checked the code with the magazine three times, so I'm
confident that no typos occured on my part, I've even tried tracking
down the original author (poor man, getting 18year old bug reports ;-)

Further details and the .atr disk image can be found on my website
http://justyce.org/atari.html

Thanks in advance, for any ideas...

jez.

Actually, 3.3a,b,c are based upon 3.2c, not g/gx. This is easily verifiable by looking at the CLOSE code where it exits to the command processor, and the fact that it doesn't use any of John Harris' patches found in g/gx. Version D leaves channels open and C closes them. I know because years ago I supplied my SRP code to a programmer that had been bugging me for it for years. SRP was the S.parta Dos R.eplacement P.roject, and was started back when ICD was sitting on Sparta Dos for years and not doing anything with it. SRP eventually had an external command processer, external batch file processor with parameter passing, help system, etc. It was designed for use on a hard drive system, unlike the regular disk based versions of Sparta Dos. It started out as a "clean room" dissassembly of version c. When FTE started making improvments with Sparta I decided to stop development of SRP. I had several a8 hard drive users using it at the time, some of which are still around. But we had the attitude that we shouldn't release it as long as FTE or any other company was supporting it. If we had released it, it would have blown away even the cart version away, although the cart version was still best to use on a floppy based system. SRP was for hard drive systems.

He finally threatened me with a lawsuit about something totally unrelated to SRP, but did have to do with some code I wrote. He then suggested that I give him my SRP source code as a settlement. I gave him the source to an early version of SRP that still had the embeded command processor. I feel strongly that that was the reason for his original threatining was to get his hands on my source. I feel he then used it as the basis for version a, etc. I'm glad I didn't give him the source for the more advanced version. Of course he told me that he didn't use my SRP code, and that he couldn't use my SRP source. But I know better, considering the man, and the code signatures of certain parts. He was just too lazy or ignorant to do it himself.

There, now everyone knows the true history of this issue. There's plenty more where that came from but I see no reason to air it out now.

I support Lance's and Bob's efforts to advance and support Sparta just as I did when FTE owned it, and will continue to refrain the release of SRP as a free product.

"I don't give people HELL. I just tell them
the truth and they think it's HELL."

>partition (at home).

I tried it yesterday, but could recreate the problem, probably because I have no clue how to reset the 'last message read' counter. But I'll try a SIG I usually don't read next time. I do believe the problem was that hardware handshake wouldn't work as it was supposed to be. I had this problem on BecoTel, but Bernard left the BBS scene after a power failure damaged his computer. He used an Amiga at the time I guess. Since Bernard left the scene (his site is still up, but I'm not sure he keeps it up to date anymore) I'm using Thunderdome BBS (SysOp Fox-1) as my main BBS.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

The answer is that the resolution of most TV screens in those days before S-VHS and video-philes was roughly 640x480 at its highest resolution. Most everyone hooked them to a TV. Monitors were for the "serious" computer guys. I think the Atari's maximum clock rate to the screen is 320x200. Roughly half the resolution of TV. You can see 8 pixels per char at 640 is 80 chars..at 320 it is 40. So I am guessing it was a pixel clock-rate issue complicated by the crappy CRT tube design. (The first "COLOR" TV I hooked mine to actually was a tube type Zenith TV with an analog tuner. And I walked uphill both way to school!hehe)

80 Columns probably was like low pass filtering your display (blurry). Like the other guy said.. at 80 columns it looks like crap ;)

It did take a huge amount of time. I did not understand all of it to
begin with and that was why I brought in another person to help. We
never put the source out on any BBS's or made it publicly available.
could you imagine the amount of hacks that would get done? As to these
other people that posted telling me I did not do this, well, I really
could go and compile a version 3.3d right now and release it. Of
course the only new addition would be my name embedded into the
Startup title. Or I can start taking feature requests and implement
them. At any rate, I will be forwarding all the messages in this
thread to my partner for his views as well.

When I first did this I knew of the problem and did not want to
introduce those bugs back in so I simply put the proper fixes there.

Hi there!

I just updated the Epyx Shrine with two pages:

Crush, Crumble & Chomp + Dragonriders Of Pern

Featured are both manuals, a very long interview with Jon Freeman & of course everything else I usually provide...

Two things I want to ask you for:
- Please vote in the 2nd Epyx poll if you haven't done so yet.
- The next page is about 'Lunar Outpost' and once more I need the manual, so if someone can point to, scan or even type it: Please contact me!

Hope you enjoy the new pages,
Manuel

495. New Atari800win PLus 2.7b!

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-18 08:32:16 UTC
From: Emmanuel Fernandes <manu@writeme.com>
Message-ID: <9469cc$eg9$1@ail.sri.ucl.ac.be>
Source record: 39266

Hi Everybody!

The new version 2.7b of Atari800win PLus emulator has been released!!! Have you ever heard about the Atari800win PLus emulator ? Well, since Richard was not updating his Atari800win emulator and since the sources were available, Tomasz Symankowski (with the help of Piotr Fusik), from Poland, did the job of making corrections to some bugs in Richard's version, and adding new features. Since Tomasz and Richard were not working together (essentially due to a lack of communication...), the new project was called Atari800win PLus. You have to take a look, the work Tomasz and Piotr did IS GREAT (there is even a help file now !!!)... Many bugs has been corrected, and new features are available... So take a look...

The URL is :

http://www.a800win.atari-area.prv.pl/ (This is the main site in Poland - VERY SLOW)
http://users.swing.be/Atari800winPL/ (This is a mirror in Belgium - Much faster....)

Bye,

Emmanuel.

I checked this last night, and unless I've screwed up somewhere (which has to be considered as a possibility I suppose <g>) the input voltage seems to be somewhere around 6V, and the output is a bit less than 1V!! The heatsink is giving off a lot of heat around the 7812, so I guess it must be fried...

I have to admit that I was a little pushed for time, so I'll check it again later this evening, and if I get the same results, I'll be swapping out the 7812 just as soon as I can get hold of a replacement.

Is there a "best" way to test a regular A8 9VAC PS under load?

Second part of this question: Only a couple of devices such as the Indus drive used a DC power supply. Presumably their motive was space and maybe less heat in the drive. (?) Any other likely motives for their using the DC supply?

Third part: I have read that any unfiltered AC (ripple) voltage is bad. Yet (virtually) no one went to the trouble to add things like Zenier diode(s) to really clean up the DC on drive boards. How clean is clean for devices like our drives and cpu consoles?

Thanks,
Larry White

Hmm, just the same as any 600/800XL and 65/130XE game.
Getting them to the atari is the problem.

You should find a good lish here :-
http://www.newbreedsoftware.com/xlsearch/

And the FAQ for all things atari (and transfering files between PC and
atari) Here :-
http://www.landfield.com/faqs/atari-8-bit/faq/preamble.html

Hope that helps

Yes, Use either a lantern-type flashlight bulb (6 to 12 volts) or an automotive taillight bulb. If you use the 6 volt bulb, don't leave it on for too long or it will eventually burn out.

>
> Second part of this question: Only a couple of devices such as the Indus drive

One other likely idea is when (NOT if!) the voltage regulator goes, it's easier and cheaper (especially for the technically challenged) to replace the power supply than to do component replacement (desoldering-soldering) on a PC board.

The accepted maximum allowable ripple for power supply is (if memory serves) 1% peak-to-valley. However, some CMOS devices can be sensitive even to this tolerance. Zeners are great for clamping a voltage for a certain level, but I'm not sure how well they react to any current resonation set up by the ripple voltage. Maybe someone out there has a better answer than I can give involving Zeners.

I almost want to say you are on your own now. This much heat means your 1050
may let out the magic smoke they put in those chips.<grin>
>
> I have to admit that I was a little pushed for time, so I'll check it
> again later this evening, and if I get the same results, I'll be
> swapping out the 7812 just as soon as I can get hold of a replacement.

But... I don't think so. I think the 7812 us getting hot because it is
literally working so hard.

I can only think of two reasons you would get this condition.

One is there is a dead short in something down stream of the 7812. Maybe the
spindle motor burned out. I can't recall off the top of my head, but they
may run the head positioning stepper on 12V too.

The other is the voltage doubler circuit went south and is either not
putting out the voltage it should. Sometimes when you pass to much AC to a
regulator they run pretty hot.

With everything unplugged, I would check the resistance between the
output<and output> of the 7812 and ground. I just did on one of my drives
and you don't get a good reading because the caps on the board are charged
by the DVM testing voltage, but you should see several hundred Ohms
resistance on both sides.

The reason for this IIRC is everything that uses 12V on the board is either
switched by a descrete transistor or by a transistor array => something like
a 2907<6?> 14 pin dip.

If you get low resistance on the output => transistor array is bad.

If you get low resistance on the input => bad cap in the voltage doubler circuit or maybe shorted diode.

I really think the 7812 may be OK. It sounds like its thermal protection circuitry shut it down.

504. Multimouse and Turb-Basic XL

If you mean cheap and easy, that is where I live. I would just use an automobile tail light bulb. If it glows bright, it is working. If it maybe just heats up until it is red, it is busted. No need for any rectification or any external parts, just jumper the the transformer plug straight to the bulb's contacts.
>
> Second part of this question: Only a couple of devices such as the Indus drive
> used a DC power supply. Presumably their motive was space and maybe less heat
> in the drive. (?) Any other likely motives for their using the DC supply?

I've got an opinion but it isn't based in fact. The 1050 with its voltage doubling circuit was a serious mistake. Apparently they wanted to use standard Atari 9VAC transformers. Typical full wave bridge rectification only gets ~1.4 times the AC votage or 12.6VDC which you can't run through a 12V regulator and get 12V out.

So everything 12V in an Atari drive is a kludge. If a normal person started over from scratch, the first thing they would get rid of is the 9VAC supply. I assume the Indus reason for using a DC supply is because they had some normal people working there and a cheap supplier of DC wall warts..

From what I understand, they also produced drives for other systems. This meant they weren't slaved to doing everything exactly like Atari would do it.

I suck at power supplies, I have never made a good one when viewed on a scope for ripple.

What I have noticed is a lot of equipment seems to be able to handle a lot of ripple in power supplies. I guess everything ripples in sync so as my 6502 drops from 5.25V to 4.5V, so does my POKEY.

its the other way round there are problems! Pal uses more lines than NTSC, so playing a european game on a US machine cuts off the bottom of the display. This affects the programs functionality. apparently using a monitor for display fixes this.

on NTCS games on a pal system apparently there is a colour bug, pal machines only really having 225 colours rather than 256, this means some interesting colour mixes on a pal system if running an NTSC program that uses those missing colours. It is however rare and almost never affects functionality. There is one other item, An Avolon Hill game that uses a flicker effect for display! The timing was out! and the effect was akin to a strobe light, not good on the eyes when playing a long game.

Basicly no major problems unless the programer tries to be a little too clever with the display.

508. Sacramento area Atarians? (Want to form a club?)

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-18 17:23:50 UTC
From: William Kendrick <nbs@bolt.sonic.net>
Message-ID: <GEF96.47$94.1728@typhoon.sonic.net>

I'm curious if there are many Atari users in the Sacramento area.
(I live in Davis and work in Sacramento)

If so, would people be interested in creating a new users group?

I am aware of the Yolo Atari Club, but unfortunately I moved to Davis
just in time to attend YAC's very last meeting. (A core member moved out
of town.)

I also recently discovered that the San Leandro Computer Club is still in
existance, but they're very far away, focus mainly on PC's now, and most
importantly, their meetings are on the same day that the
Linux Users Group Of Davis meets. (I'm president; kinda need to be there.)

My main interests in the Atari realm are 8-bits, Lynx and Jaguar,
as I own at least one of each. My experience in clubs include co-founding
(and now running) a 150+-member Linux user group, and a much smaller
(and more informal) game design club.

My reasons for wanting a club would simply be to hang out, play games,
have fun, and possibly even do some hobby development! :)

Anyone interested!?!

It's not called Wargames at all. It's Computer War. I thought it was a blast way back in the old days. Still got a copy lying around I think. Yepp, there it is. But, mine is on tape.

> and you don't get a good reading because the caps on the board are charged
> by the DVM testing voltage, but you should see several hundred Ohms
> resistance on both sides.

Ok, I did that, and I don't think you are going to like the result... :)

With the power disconnected, it seems that the resistance between input & ground is about 500ohms, and between output & ground seems to be zero! I tried the same on the 7805 and got about 750ohms on the input and 350ohms on the output.

Now, does that sound as if it indicates a short somewhere or a busted 7812 or a bad transistor array?

I'm going for a lie down in a quiet corner of the room :)

I've got 2 favorite places to scrounge around for software for my XEGS and 800XL. One is the U of Mich archive at http://www.umich.edu/~archive/atari/8bit/ Good applications, a few good games but they're all shareware/freeware/public domain. A better place for games is the Closer To Home website at http://cth.dtdns.net/index.html for a better selection of games. There's also a couple of mirrors to the Yogi archive floating around that had some huge disk images with tons of games, but I don't know where to find them exactly.
Of course, the next big challenge will be to get the programs from the internet to your 8-bit :)

Hi,
thank you for your answer.

I thought it could exist on the PC some good program (like those useable for Spectrums) allowing me to convert tape images to WAVS, ready to record on a tape recorder directly.

Cheers

515. Please help me track down a favorite game

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-19 06:32:48 UTC
From: bsears9355@my-deja.com
Message-ID: <948n2h$oc7$1@nnrp1.deja.com>
Source record: 39292

I hope that there is someone who can help me. I would like to track down and hopefully play a game for the 8bit atari computers which was a favorite of mine circa 1985.

The game was called "Gauntlet", but it was not anything like the Atari arcade Gauntlet. This particular game was shareware. The author of the game included a rather length set of instructions at the beginning of the game before you get to the screen where you set the game options. In the game, you controlled a space ship which could be accelerated in 8 directions. The ship could also fire in 8 directions. There were 50 screen that you had to get through, one at a time. The last twenty or so screens you went through caves. There was a force shield that you had to maintain on your ship. If it went down to zero, your ship blew up.

In the instructions, the author talked about an improved version of the game that you could get by sending him $35 or so.

Anyway, I really would like to track this game down. I originally downloaded it from a BBS in 1985. It was a great game and I miss it. If someone has this game on a disk, I would gladly pay you to make a copy of it and mail it to me. I have a 130XE and an 810 disk drive.

Thanks.

> monitor for display fixes this.

Not true. Unless the pal game uses more then the 192 lines for the
display, this won't happen. It is more like the timeing of the VBI,s
that causes the problems.
Ntsc has less time for the vbi then PAL If pal uses all of the time
avilable, then it won't work on NTSC. or be very jumpy or be cut off.

My first guess is that the program was written for a machine with less ram, so the data moved, but the program doesn't where to look.

The other is that the program uses some code/location that is 400/800 specific, while the emulator is XL/XE. Try the translator with the eumaltor if possible.

How would I extract the source from a .ATR without an emulator?

Body handling: HTML body converted to readable text

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or atari@pacifier.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs. After I post this
message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

I've switched ISP's! Try www.pacifier.com/~atari or atari@pacifier.com

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs.
If you can't get Catalogs that way, Feel free to Request them through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or
atari@pacifier.com. If you can't reach me at benjamin.net see my
E-Mail/Web info in my Signature at the Bottom!

Bravo Sierra Computers has Moved! To a New ISP! Now Hosted on pacifier.com!!! Atari 8 Bit,
ST and Jaguar Hardware/Accessories, Software/Games & References/
Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's
SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received
Through E-Mail at atari@pacifier.com or atari@benjamin.net and Please Specify Atari 8 Bit,
ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

I also remember being impressed with this one. It was technically
excellent and did unusual things for an Atari 8bit game. There was a
lot of varaiation and the graphics were detailed.

I used Bill Kendrick's XL Search to find Gauntlet and so can you:

http://www.newbreedsoftware.com/xlsearch/

If you track down the deluxe version, please let us know!

That would be Gauntlet by Donald R. Lebeau in 1984. The best I can do
is an EXE of it for use either on an emulator, or to transfer to a
real Atari via an SIO2PC cable and transfer software.

I do remember this game though. It was fun -- and it was the only
game I remember where you could shoot up the terrain. :-)

This is possible, since no emulator I've found will emulate less than
64k, but I can't see where that would be a problem.

>
>The other is that the program uses some code/location that is 400/800
>specific, while the emulator is XL/XE. Try the translator with the

The emulators allow the specification of whch ROM to use (OS-A, OS-B,
XL/XE or 5200, all with or without BASIC) so translator disks are
unnecessary.

>
>How would I extract the source from a .ATR without an emulator?

The BAS file (and any supporting data files) would have to be saved to
separate files and then transferred to a real Atari via SIO2PC or
accessed via APE.

I'm pretty sure it was called Wargames in the UK and even had similar
boxart to the film. At the time I thought it was odd as none of the game
seemed to reflect the film. OTOH it was 20 years ago so my memory may be
fried.

Nope, it was indeed called Wargames.

The game by Coleco was pretty dull, nowt much about the film bar a
passing reference at the games start.

Olav,

If it's the large bar listed under the OS, then it is the OS chip that is bad. It's failing checksum. Just replace it with a new XL OS chip that you can get from B&C Computervisisons.

Or if you can find another XL computer (except for the 1200XL) or a 65XE or 130XE will have the same OS chip.

Heck, this really makes me feel good. I'm kind of perverse that way! Closer we get to having it cornered w/o bringing out a soldering iron, the better in my book.

Armed with my most recent dose of enthusiasm after reading this, I dug out my SAMS Computer Facts.

In no particular order. The voltage into the 7812 is listed at 17.8V. TP14<test point 14> is the output and is listed at 12V of course.There's nothing but low value caps to filter the output, so IMO they would have exploded like a popcorn kernal if they had shorted.

Looking at the stepper motor, Jumper J15 pretty much completely disconnects it. With the drive facing you, this in in the back right hand side. Unplug the jumper and test resistance on the 7812 output to ground and if it is still near zero, your stepper is fine.

The spindle motor is J1, 3rd from the back left. It should be plugged in REVERSED. This has been the case on every 1050 I have ever seen. Sometimes people see the other jumpers nicely plugged in a row and put J1 in so it is aligned with the other jumpers, this is wrong, it should stick out like a sore thumb.

Unplug J1 and test for resistance. If it is still low, then it is probably the 7812. Looking at the output transistor for the motor, it is a TIP110 and if it blew the drive would spin continuously.

There is other stuff in there that uses 12V, but most of it is pretty low power and I can't imagine it being the problem w/o giving off a dull red glow when you turned the drive on.
There are some other parts in the stepper circuit that could go out, but they are feed with 12V through a 47 Ohm resistor, so even if they were fried they wouldn't give zero Ohms.

What would the 'smart' cartridge do that the current 'pull' cartridge
does not?

> - a fix for the /X bug

Please describe this one too.

> - Boot with or without MEM.SAV

Why? I want MEM.SAV only when working with BASIC or other 'language'
carts like MAC/65, ACTION!, etc. That way, with minimum DOS usage, one
could return to your language cart with data and program entact.

> - a fix for the append bug. You need an extender or atleast a period
if you
> want to append files

I'm using 4.50 and I don't have that problem at all!! I append quite a
bit and I've never had a problem with 'short' filenames, period or not.

> - add an option to RAMBOOT (usually called RBxx) so we can leave

problem above.

I'm pretty sure this would be written into the RAMBOOT program - it
needs a rewrite?

> - Toggle non-sorted/sorted directory

Can't sort DOS 2 type directories with file numbers. File positions on
disks of Mydos type '3' disks would still have to be moved. Easier to
rewite the entire disk/drive in the order you want, basically thats
what you would have to do anyway, so write a program that does it, and
hope the power don't fail while its running.

> - Show an error when a file is not found during copying.

I _Never_ have this problem with 4.50!?! Are you using 4.53/4?

> - When an illegal character, e.g. '^' is entered in the filename,
MyDOS should
> tell us that. As it is, it just tells you that the file is not found
in this
> directory.

I agree, I think it would be nice to have all errors reported but then
Mydos falls back and shows the last input string ready for correction
and/or retying.

> - What would also be a nice feature for a new version of MyDOS would
be this.

If I understand correctly, you want a directory listing of all files in
all directories? Sounds like a job for another stand alone program to
me.

I can't find a source code file for 4.53/4 that unarcs without errors,
anybody want to email me one that works? Thanks. Melee5@Deja.com
works BTW.

There is a non-Java index of all the pages on my site. Just click the lower
link from the main page. The Collectors List is all the way at the bootom.

This isn't the nicest looking solution, but it works.

I have the original Thorn EMI "Computer War" package in front of me. It
says
"Based on the Hit Movie"
"WarGames"
"Is it a game, or is it real? MGM/UA"

Hawk, I will send you a list in few days. It needs a little updating
and I won't get to it before Sunday.

Does anyone need either of these?

Sega Zaxxon Cart
Sega Congo Bongo

Both cart only, but in good condition. Can scan them if needed.
I will trade for other 8bit carts, or rare 2600 carts.
Send a list to me of what you have to offer...

The reason Netscape chokes is because he's using frames and in his
fraMain frame, there's no source specified. He should put a "blank.html"
page there initially and then let his navigation load the What's new
stuff when everything loads.

Thanks for the tip, but I'm running Mozilla (IE5.01) and don't have any troubles with any other files except 'MY453SRC.ARC' and then only when unarcing. I get 'file fails CRC check' error on around four of the ten or so files in the arced package. SuperUnarc does the exact same thing on a real Atari, and there are some files missing according to the readme, so I assume its because the original upload of the file was tampered with and is bad. Its also bad no matter where you get it. Posting of the complete package by the author somewhere would be a real sweet deal. Thanks again.

562. TECH: RGB Output from Atari 800XL

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-20 21:58:46 UTC
From: e9325367@stud1.tuwien.ac.at
Message-ID: <3a6a0890.39757583@news.teleweb.at>
Source record: 39334

Hi !

Here's what I want to do: Plug my Atari 800XL inside my Arcade
Cabinet ... Fairly simple task except the video, as the atari output
is only composite video, but I need Video Red, Green, Blue, Ground
and Composite Sync.

I found somewhere a modification for TTL output, which worked
somehow and gave me a picture on my Arcade monitor (I just
wired pins 11,5,3 (R,G,B) and 14 (Comp. Sync) as well as pin 8
(ground) of the CD4050 onto a JAMMA fingerboard)

The problem is, that I don't get the right colors, I tried all
variations of pins 11,5,3 on the different RGB pins of the
fingerboard, but was not able to find a right set.

I assume, that the pins I used are the false ones, anyone
in here has any concrete info or can tell me where to find
schematics for an PAL Atari 800 XL ?

Please HELP !!!!!

Thank you
Mark

Message-ID: <3a6a1bf8.40684715@news.CIS.DFN.DE>
Source record: 39338

I just tested A8jdpeg (the jpeg viewer) and it was very impressive. It displays jpegs in several modes. The finest resolution is Graphics 8 at 320 x 192 in black and white. The most useful mode is the 16 shades of gray mode with the long pixels at 80 x 192. There is also a 4 shade mode in between, again gray scale,a s well as some flicker modes which double the resolution, I believe.

The viewer is reliable and easy to use. I though it might need a front end pick and choose menu, but it is okay as it is. You can use a wildcard to view the disk directory. It would be nice if you could set it to automatically view the pictures, slideshow style.

The program seems reliable and speedy considering it's a little old 6502 decoding those jpegs.

http://www.geocities.com/rjespino/atari.html

I'm glad the Atari 8bit community now has a JPEG viewer. Thanks Raphael!

It's been a long time since I've even looked at it, but my guess is that
you can do what you want. Just find the last address it uses, LOAD it
in from the Sparta command line, drop to BASIC and poke MEMLO with that
address, and type NEW. When you LOAD it be sure to type "LOAD READER.COM"
at the Sparta command prompt so that it doesn't actually run. You'll have
less BASIC code space available but what the heck? Then look up how to use
the BASIC USR function in the SAM docs and try using them, it should work.

>> DOS 2.5.

I've forgotten what the MEMLO of TBXL is, but my guess is that it moves it up a bit, possibly wiping out the Multimouse driver. There is a way around this if this is the case. I did it once with an R: driver and the disk based Sparta DOS version of TB. You just have to load the driver to the bottom of TBXL's BASIC program buffer, and move MEMLO up to cover it and type NEW. Of course after you find out what this address is you'll have to configure the Multimouse driver to load in to that address. It's been so long I might have gotten the details wrong.

575. Adventures "Seramis" and "Mord an Bord"

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-21 17:52:52 UTC
From: Alexander Schiebel <a.schiebel@aon.at>
Message-ID: <3a6b219c$0$19148@SSP1NO25.highway.telekom.at>
Source record: 39198

Can anyone help me? I've just gotten an emulator and been looking for two favourite adventures of mine.
The first was named "Seramis" in German, I don't know what its English title was or if it even has been translated. It was based on the same engine as the adventure "Atlantis". My mother and I spent months of playing this until we found out about a bug on Disc 4 right at the end of the game. :-(
The same was with "Mord an Bord" (which means murder on board), which was a great text-only adventure. Unfortunately I never got past the discovery of the dead body, for there too was a bug on the Disc. :-((
Now I'm desperately looking for those games. They have been published or created (?) by Axis Software (if that helps). Unfortunately the Atari games search engine didn't come up with anything, so I thought perhaps one of you knows something about those games.

Thank you!

Btw: It's nice to see that there's such a large fan community about the Atari 8 bits!

Nice greetings

:-) Alexander

576. Atari BASIC Question About Text Window

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-21 17:52:57 UTC
From: DCM01@USA.NET
Message-ID: <3a6b1ff8.194948@news.CIS.DFN.DE>
Source record: 39197

Most 8bit owners are familiar with the graphic modes that open with a blue text window of 4 lines at the bottom of the screen. GR. 7 is such a mode.

When I would program things in the straight text mode GR.0, I found it convenient to move the cursor around with the POSITION command, which would give me precise control over where my text would go without disturbing any other text on the screen.

My current situation is that I can't seem to make the POSITION command work in GR.7's text window. So I'm left with inserting a lot of spaces here and there, reprinting a lot of text, and I get an ugly scrolling as the new text bumps the old out of the window.

I did review my programming referenec materials, but could nnot find anything. Does anyone know if the POSITION command can be used in that text window?

You might want to be cautious of saying that out in public, now that
eBay is banning people for selling below the reserve price.

Hi everyone,
Can someone point me in the right direction to fix this. I recently got a working Atari 400 (UK version) and it worked great. Played with it for a couple of days then put it in the loft for 2 weeks. I got it down tonight and it fired up ok (I get a power light and the keys click) but the best picture I get on the TV is a black screen with diagonal lines. Has the RF blown or does something need reseating?

Thanks for any help.

Richard

Let me see in my schlaues book:

a POS.-Command in the text-window can be done like this:

POKE 657,X:POKE 676,Y:?"Text";

Add the ; to hinder, that the text-window will scroll, if you POSition the
text into the last (4.) text-line.

Yes, we know that "No", it cannot; the big however is that Mapping:

http://www.atariarchives.org/mapping/

tells us that the row (0-3) can be set by POKEing 656 and the column (0-39) by
657. The always zero high byte is in 658.

I have the impersonator, but don't remember much.
The 'Pill' probably worked the same way.
I'd recommend getting an Omnimon OS. The RamRod OS modification
allows using up to three OSes.
Omnimon is the only way I know of to interrupt a cart and dump it
to disk sectors. The Impersonator and Pill I think require plugging the
cart in after you have the machine on and booted.
You have to be facile enough to be able to take the sectors you write
with Omnimon and make a file out of them. Then you have a straight
dump of the cart.
I wrote a program that will take sectors from a disk and make a file.
There may be other ways, but that's the way I do/did it.

taken from faq

For carts, copying could involve cracking or again there
were/are products to reproduce the cart and simulate a ROM.
Or the cart might be copied and burned on the correct type
of eprom, to make a plug in cart. 'The Impersonator', the
'Pill' are two cart copy schemes copy the cart to a file,
then don't change the code, but use a 'dummy cart' to fool
the software into thinking there is a ROM present.

so if worse comes to worse I can use a 'The Impersonator' or 'Pill'
device and use the output file and burn that to an eprom cart and play
the new cartridge

We had something here in australia Called a cramp board. It has 2
chips on it that when enabled, The ram where the cart is cannot be
written to. The software included a move util then enabled the board.
Worked well on carts that wrote to them selves for copy protection.

> if it blew the drive would spin continuously.

As you said, J1 was plugged in reversed. On removing it, though, the
resistance at the 7812 output to ground is still zero. I was very busy
this weekend though, and I onl managed to grab 10 or 15 minutes to check
this, but I am pretty sure that the resistance was zero no matter which
of the jumpers were plugged or unplugged.

Hopefully this is narrowing things down, you certainly understand what's
going on in the 1050 better than I do :)

Is this suggesting any other options to you, or is everything pointing
to the 7812?

Thanks again

Geoff

So your saying the C64/C128, the Apple II and the MSX computer are all for "serious" computer guys?? I don't know about your part of the world, but in mine, C64 owners usually only bought the computer because the software (read: games) were available 'for free'.

The "monkey wrench" was the only one I was aware of. There may have been
something to allow you to copy whatever cart was in the OTHER slot, too..

I read through your posts and the replies back and forth between you
and this individual. I am curious as to how you found him and initiated
the purchase of the games? Did he have a web site or was it an ebay
transaction. I would never take sides , but from his responses and
unprofessional emails it is clear he is an individual that I would
avoid dealing with.

Sorry to hear you had a bad experience.

> how?

Virtually every cart image I have looked at used "CARTCOPY" to make it. All it did was lower RAMTOP then use a illegal JSR $F3F6 <or indirect RET, can't remember> and append the cart code on the file and use the RUN/INIT vectors from that.

All you should have to do is clean up the image by getting rid of the extra junk.

Been a while, but I am pretty sure there was a way to load a program w/o running it, /n option or something. You would have to lower RAMTOP first, pretty simple, just store ~$80 in 106 and open the screen via CIOV. Load the file /n, then do a binary save $A000-$BFFF from DOS. This will prepend six bytes, $FF, $FF, $00, $A0, $BF, $FF,<?> to the file, but most EPROM burners can take care of that by just changing the buffer address.

> to the 7812?

That is the leading suspect. I am trying to think of a cheesy way of doing it, heat sink prevents easy removal and all that.

You have a couple of choices, either try to save the 7812 or do less damage to the PC board by cutting the legs off before removing it. I would probably go quick and dirty: Use a diagonal snip to cut the output pin and check for resistance on both sides of the cut. If the side attached to the 7812 still reads low/no resistance, it is the 7812. If the side attached to the 7812 reads high, that narrows it down to maybe 4-5 parts on the PC board and you can just solder the leg back together.

There's another thing you should try if you look at the 7812 . While the 7812 output is disconnected<one way or another> check the solder pad for the input. See if you get the nominal 17V input when the power is applied. Long as you are fixing stuff, might as well make sure the voltage doubling circuit is working.

Here's hoping it is the 7812.

606. Re: Please help me track down a favorite game

Well,
the game was also called "Gauntlet", since it appeared years before the
Arcade version. But, after the arcade version had come out there were
quite some difficulties which game was meant when one talked of
Gauntlet. Since the commercial version was far more popular, most users
decided to give the Shareware version another name. Some used "TELTNUAG"
(Gauntlet backwards), some called it "PD-Gauntlet" or used other silly
names. Most often you can find the game under the TELTNUAG name...
E-Mail me if you cannot find the the game anywhere and I may send you a
copy (but my version is packed and shortened: it does not have the
instructions anymore; only the title/copyright screen !!) -Andreas

With a smart cart there is no need to plug out/off the cart !! You can
just leave it in the cart slot... (Remember those hundreds of game and
tool / application carts for the A8, they do not need to be plugged
out!) -Andreas

613. Re: Adventures "Seramis" and "Mord an Bord"

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-22 15:48:24 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3A6C5648.44A346C9@mail.uni-mainz.de>
Source record: 39233

Hi there !
Sereamis and Atlantis (of AXIS/Ariola fame) appeared only in german language or as german versions. Both are now Public Domain, since the authors of both games gave them free around 1989 (an article appeared in the old Atari magazin and from that time on the games can be found in many german PD libraries). The PD version differs from the commercial or pirated version, the PD one has no title screen or title music (from Kemal Ezcan), it directly starts the game. Unfortunately the bug (found at the end of the game Atlantis) still remains in the PD version...

Well, "Mord an Bord" was it one of Ataris own titles (published by Atari Germany/Hamburg, like some other -german only- games) ?? Ask Wolfgang Burger / ABBUC, he may have one left. But maybe the game is also known as "Murder on the Zinderneuf". I am not sure about that, since I do not know them very well. Murder on the Zinderneuf appeared via Activision (or EA?), I guess. The disk version had an LP-style package... -Andreas

P.S.: games from Atari Germany: - Karriere
- Oelbaron
(german only, I believe) - Schloss des Grauens
- etc.

I know. I replied as soon as I saw the word Gauntlet. That's what most people has asked for earlier and this is a totally different game. Had I taken the time to read all, I wouldn't replied like a dumb ass "Dandy Dungeon". Well, hopefully I learn to read more carefully in the future.

There are, but many either use their Ataris for a specific purpose and
don't need/want a club or they are not on the 'net.

> I am aware of the Yolo Atari Club, but unfortunately I moved to Davis

Yep, that was me. I rather miss YAC, as it was a lot of fun. By the
way, is Eric Hays still about? I don't have a current address.

> Germany/Hamburg, like some other -german only- games) ??

"Mord an Bord" was made by AXIS and published by Ariola. It came in a huge,
LP-like flat box that was so typical for AXIS/ARIOLA software boxes.

> But maybe the game is also known
> as "Murder on the Zinderneuf".

Definitively not. The scene of 'MaB' plays on a ship, an oceanliner if I remember
right. 'MuZ' has a Zeppelin as its playground...

> Murder on the Zinderneuf

Electronic Arts.

There have been a lot of german only titles in the middle 80s released, even
Jump'n'Run (Schreckenstein - good one!, Cavelord).

Gruss,

Andre

Well, nobody would have listened; in early 1980 I was 2; in late 1989
I was 12.

And, having such bad eyesight as I did, I never even TRIED typing in
those damn things. Well, I think I tried once and got like twelve
lines in or so.

> At the very least I'm surprised that COMPUTE! and etc didn't print

If I'm not mistaken, the Atari magazines weren't so smart. They had
us type in decimal, meaning three keystrokes per byte.

Besides, typing in BASIC programs was more fun, it taught me to program.
I remember my dad typed in one such program, and changed one PRINT
statement to read "STEVE'S REVENGE" instead of the original title, which
also had "REVENGE" in it.

> They could have typeset the program listings along the margins

Bah, too well-designed for second-generation micros like that. Keep in
mind that hardware companies only built stuff that the computer was
built to handle until about 1990. Disk drives, modems, printers, and
other things a child might read about in a book about computers. People
weren't looking for neat and novel things to do with hardware then;
mice cost ten times as much as they do now, and if you wanted to
digitize sound or pictures, well, that was super-dee-duper SPECIALTY
equipment that was hard to find. And as for an optical magazine-

program scanner, I'd like to see someone design such a thing such that it would be easy to make, or mass-produce at reasonable prices, in the 80's. Because if it was possible, it's completely stupid that they didn't do it.

Then again, you could print your own backups and have no need to spend a thousand bucks on a floppy drive.

There was a technology called Cauzin "softstrips" which were a high-density bar-code that could be printed and placed in magazines.

I know that Byte (and I think Dr. Dobbs) each had some experimental issues which contained some of their source in this barcode.

I don't know if the technology was too expensive or too unstable, but it didn't seem to take off.

Huh? There were paper tape readers for microcomputers in the early days.

A reader was easy, a punch more difficult. There were programs
distributed in the early days of micros on paper tape, because there
were people with tape readers.

But even that improved, when non-mechanical tape readers hit the market.
There was one, I can't remember the name now, that was basically a litel
box with a tape guide, and 8 photodiodes. You'd place the box
under a lamp, connect the box to a parallel port, and then pull
the tape manually through the tape guide. Where there were holes,
the ligh shone through to the photodiodes, and that bit would be
high. One advantage was that since there were no mechanical parts,
one could pull the tape through the guide fairly fast.

And one or more of the computer magazines, maybe Creative Computing
though I can picture another one though not the name, tried distributing
programs with those flexible 33 2/3 RPM records that were often a feature
in magazines at one time. But instead of music, they'd put a recording
of a tape interface output. So you'd connect your tape interface
to your record player, instead of cassette player, and get your programs
that way. I don't think any magazine ever did it on a regular basis,
for reasons unknown. Maybe it was all too costly. Though, those
plastic records added nothing to the bulk of a magazine, unlike
a cassette tape, which had advantages when mailing and distributing
the magazines.

And Byte, in the very early days, used barcodes to distribute programs.
This was about 1977. There were some articles about bar code readers,
and a construction article or two, and some programs printed in
the magazines in the form of barcodes. I can't remember how long

it went on for, and if was a regular thing, and I can't be bothered digging through the magazines. Byte even published some "books" that weren't much more than an introductory article and some large program in the form of a bar code printout.

Curzon strips came later, though I felt at the time they deliberately overlooked the earlier use of barcodes to distribute programs I always though the curzon strips were nothing more than a higher density "bar code".

There were also some attempts to distribute programs over the radio. I recall some plan to use a subcarrier on an FM broadcast transmitter to send such programs, though I can't remember if that was an idea or if it was actually implemnted. I thought at least in Europe, something along these lines took place.

It might have even been over television audio, on one of thsoe introductor to computer programs that took place in the late seventies or early eighties in various places.

The idea was update a few years ago, when Computer Chronicles on PBS was doing something via video. I forget whether it was programs they were distributing or something else. It was just a few years ago, and it disappeared with little fanfare.

Of course, Computer Chronicles is getting pretty old at this point. I can remember when Gary Kildall of CPM fame was a regular part of the program, and it wsa more for the insider.

Source record: 39153

Howdy folks

Since for some reason WinVN closes the connection before I can finish long replies (and reconnecting usually only makes things worse and guess what, there is NO way to save my reply in any way), I had to prepare this one at home.

Re: the NOTE/POINT bug in MyDOS

On the first sector (and only on the first one) MyDOS counts from byte 0 to byte 256.

Re: difference between a 'smart' and a 'pull' cartridge.

A smart cartridge can have a lot of features and still only use little computer memory. There's 64kB inside the SDX cart. MyDOS takes up less than 12kB. And cartridges can go as high as 256kB. And 'smart' carts can be 'pass thrue' carts.

Re: the /X command

If you use for instance

FILENAME.EXT,NAMEFILE.EXT

to copy a file, MyDOS will assume you don't wanna swap files. If the above is followed by /X, you will be asked to swap disks. Atleast, that's how it should be, but /X doesn't work.

Re: boot with/without MEM.SAV

I usually don't need MEM.SAV and to save memory (not all my computers have 1MB of extended RAM) I delete it right after the computer is ready booting.

Re: the append bug.

I'm using 4.53/3 but have used 4.50 before. I can't remember whether 4.50 did or did not have the same bug.

Re: RAMBOOT

It sure needs to be rewritten.

Re: Toggle sorted/non-sorted directory

MyDOS only uses filenumbers in single and maybe enhanced density. So it would be possible in double density. But the directory doesn't have to be sorted 'on disk'. It could just as well be sorted 'on screen' only, just like Atari Writer does.

Re: If I understand correctly, you want a directory listing of all files in all directories?

No. I want to get rid of the 64 file per directory limit. But that would mean that all current versions of MyDOS wouldn't be able to read these disks. So I came up with a solution that would get rid of the 64 files per directory for a new version of MyDOS, but still enable existing versions of MyDOS to read these disks. (Don't read me wrong, this is jus an idea. I don't have the knowledge to turn this into software!!!) To existing versions of MyDOS, subdirectories ending with '.sbx' will be just like any other subdirectories. To a new version of MyDOS, subdir's ending with '.sbx' would be extensions of the directories the '.sbx' subdirs are in.

Message-ID: <3A6D8CE8.4DD7AB30@pcisys.net>
Source record: 39158

Hello Fellow 8bit user's,

I recently got asked a question about doing packet radio on the Atari 8bit computer.

Years ago, I helped a gentlemen from back east on putting a program he had for the 8bit onto
a cartridge that allowed him to do packet radio with his Atari.

Unfortunately, I can't seem to locate any information on this and was wondering if anyone out there
may have an web links to any clubs and businesses that support packet radio using the Atari 8bit
line of computers?

This program that I put on cartridge for him, if I remember right, was named PK1.COM. It
communicated with a TNC (packet radio version of a modem) through a joystick port.

Any help would be appreciated.

This topic has always interested me. Here is an article from Antic magazine, which is archived at www.atarimagazines.com. Don't know how much of it still applies considering communications changes over the last 15 years.

[Digital Antic] VOL. 3, NO. 3 / JULY 1984 / PAGE 60

TALK TO THE STARS

The world of shortwave radio & computer communications

by JACK McKIRGAN II

How does taking a crack at decoding secret CLA or KGB messages appeal to you? Or perhaps -- less exciting, but safer -- receiving bulletins from news services around the world?

You can do both, and more, with radio communications. By hooking up your Atari to a short-wave or ham-radio receiver, you can become part of an exciting way of communicating with the outside world. You can, in fact, accomplish just what you could with a telephone and modem, but without making payments to Ma Bell, her offspring or her clones!

The first thing you need to get started is a good short-wave or ham-radio receiver. Good doesn't necessarily mean expensive, although some can cost several thousand dollars. The new- digitally-controlled, short-wave radios offer high quality performance: They are sensitive, relatively inexpensive, and have stable receivers. Even better, anyone who can turn on a stereo can use one.

Next, get an antenna. This can be as simple as a piece of wire running along a wall or as complex as the equipment at a military installation.

A radio modem, also known as a Terminal Unit (TU), converts the signals from your radio's speakers into pulses that feed into your Atari personal computer (PC). (See the review of Macrotronics' RM-1000 Radio Modem in this issue.) Ham radio operators have developed many programs that will work with your Atari if you use the RS-232 port of an Atari 850 or similar interface to connect your computer and a radio modem. Some of these programs even allow you to set up an on-the-air bulletin board, provided that you have a license to transmit.

The Federal Communications Commission (FCC) set up the Amateur Radio Service so that amateur radio users could apply and test for a license to transmit voice, code and digital communications over the radio waves. Specific privileges vary with the type of license granted. But

once you acquire a license to transmit, a new neighborhood opens up to you -- the entire planet! Amateur radio even has its own series of satellites for use by the world-wide community of "hams."

Without a license, however, you are not allowed to transmit messages, or to make digital or code transmissions on Citizens Band radio.

Even if you can't transmit your own messages, you can garner a tremendous amount of information just by listening --- in fact, that's how I became a ham radio operator. Once you gain access to the airwaves, however, you can retrieve even more information. You can "hear" (via the words that appear on your monitor) radio operators chatting about equipment and see the pictures they transmit (these can then be printed on your printer). You also can receive news bulletins from the far ends of the Earth that you'll never see in your local newspaper. And, yes, covert and overt agents all over the world do send coded secrets to other agents and to their superiors. Test your programming skill by trying to decode these secret messages. Who knows -- you may have a future with the CIA. . . .

A WEALTH OF OPTIONS

There are several useful modes of radio communication, including Morse Code, radioteletype, and ASCII. With a radio modem and accompanying software, you can choose the mode in which you want to receive and transmit messages. Type in your message, and the software does the rest. Differences exist among these modes, however, and the government places some limitations on their use. Let's take a look at each of them:

-- Morse Code -- One of the first "digital" codes, this internationally accepted code consists of a series of long and short beeps that form each letter of the alphabet. Invented long before computers, Morse Code presents some problems when used with them, because the varying length of each character makes software design difficult. As a result, most of the Morse Code now being sent is sent by hand, not machine. The software used in this application must be able to analyze human-caused Variations in the code to translate it properly and this causes problems. Radio operators call this mode CW for continuous wave.

-- Radioteletype -- This mode of communication uses a five-bit code with a unique feature: most of its characters have two meanings. A control code is used to toggle between the two character sets. This code was developed for use with electro-mechanical "Tele-type" machines, and is currently the most commonly used non-telephone mode of computer communication. Radio operators have nicknamed it RTTY (pronounced Ritty).

-- ASCII -- The "native son" of intercomputer communications, ASCII was recently approved for radio communications by non-commercial and non-governmental services. This mode allows an extensive set of

characters to be sent, some of which can be nonstandard. This can be quite useful to Atari PC users because of the Atari's special control and graphics characters. ASCII is slowly becoming more popular as a communications mode for radio operators, but it will take time for its popularity to become widespread. Many organizations and amateurs are diehard RTTY users.

The following list of organizations and manufacturers may help you get started in the world of radio communications. By the way, the Atari Microcomputer Network, a users' group with more than 800 members, meets on an almost weekly basis, and the participants don't even have to leave the comfort of their homes. We communicate by radio, of course!

-- Universal Amateur Radio
4555 Groves Road, Suite 3
Columbus, OH 43227

This group publishes a comprehensive list of radioteletype stations that includes the times and frequencies for each service.

Here is another Antic article on the general subject, from www.atarimagazines.com. The Jacksonville Florida user group (JACE) was involved with this stuff. There is an old list of resources at the end.

[Digital Antic] VOL. 4, NO. 7 / NOVEMBER 1985 / PAGE 36
RADIO ATARI CALLING

Ham satellites, slow scan video, repeater stations, and more...

by GIGI BISSON, Antic Assistant Editor

Listen to Jack McKirken for a while, and you wonder how amateur radio enthusiasts ever got by without personal computers.

"Why should you have to hand-turn your antenna to track a satellite transmission, when your computer can do it?," says McKirken. He's an Ohioan who formerly edited Ad Astra, the users newsletter for ham Atarians. "Anything a ham can do, a ham with a computer can do better," he says. "Using the computer to control radio hardware is another job where the Atari shines."

Hook up a short wave radio to your Atari and you could end up with a slow scan television station, a chance to eavesdrop on the space shuttle, and friends all over the world.

You could also end up with an expensive, obsessive, but fascinating hobby. "Oh gosh, ham radio is just as bad as computing," says McKirken with a laugh, "And if you combine the two..."

GOOD BUDDIES

They work together as a team, performing feats that neither could do alone. When you combine ham radio and a computer you get (pardon the pun) a computer that likes to show off.

"There are several million hams worldwide. A vast majority of them have computer equipment." says Russell Grokett, chairman of JACE, the Jacksonville, Florida Atari users group. JACE has what is probably the largest and most active amateur radio special interest group (SIG) in Ataridom right now.

Even during simple voice transmissions, hams are increasingly reliant on computers to boost the mileage of their radios by controlling antennas and helping them home in on signals. The computer can figure the maximum or minimum frequencies and decide which is the best radio band to operate on. Hams with computers can even track a moving satellite for the clearest possible signal.

Currently, the most popular use of computerized ham radio is Radio Teletype (RTTY), the ham's equivalent of the computer telecommunications network--without phone bills. Hams with computers upload and download programs, particpate in SIGS and operate bulletin board services.

RTTY computing is only as complicated as you let it get. You could start with $100 in used equipment, or a $5,000 base station. "Your antenna can be anything from a simple piece of copper wire to massive aluminum arrays that threaten to cave in the roof of your house," McKirken says.

But hams still insist that no matter how much hardware they accumulate, RTTY is still cheaper than paying through the nose for "online time". At a peak speed of 300 baud, however, it's much slower than 1200 baud telecommunications. The other difference between "online" and "on-the-air" is privacy. Anyone with a radio can plug in and listen to ham conversations.

HAM ATARI

It probably comes as a surprise to most people that Atari computers are very popular among RTTY hams. Especially well-liked are the old Atari 800 and 400 models--which were extremely well-shielded against radio interference.

Shielding is important because computers customarily generate lots of radio "noise". This noise can totally jam the sensitive receiver of a nearby ham radio.

The metal casing inside the Atri 800 and 400 prevents interference "leakage." Though the newer XL and XE models do not have this shielding, they also work pretty well with ham radio-- a lot better than many other popular brands of computer. (Shielding an XL or XE yourself requires soldering copper sheeting to your main circuit board, or encasing the entire computer in metal. Whether or not you'd need to shield your XL/XE depends on your specific system.)

LICENSE, PLEASE

If you want to operate your own station, instead of merely listening in on other ham transmissions, you must obtain an Amateur Radio License. A Technician Class license requires greater technical knowledge than Novice, the lowest rating. But you don't need to be able to send Morse code any faster just five words per minute. And a Technician licensee gets many more privileges.

For more information on obtaining a license, contact a local ham radio store. There's also likely to be at least one ham in your local computer users group. If not, contact the American Radio Relay League. (See address at end of article.)

REACHING OUT

Disaster aid has traditionally been very big with hams. During the massive forest fires in California this summer, hams used portable stations to assist firefighters in the field, allowing communication between fire crews who couldn't see each other through the thick smoke.

When power and phone lines are knocked out during a widespread emergency, many battery-operated stations stay on the air and transmit important messages. Through it all, independent, computer-operated repeater stations would keep the communications network going.

Packet communication networks: the hams' version of LANs (Local Area Networks) exist on the east and west coast and will eventually extend across the US according to Grokett.

These packet networks are made up of "repeater stations" that receive a transmission and re-transmit it at higherpower. This can dramaticlly increase the range of less-expensive ham radios.

Repeater station are usually computer controlled. Most of them are volunteer projects of ham radio organizations. But usually any licensed amateur is allowed to use the repeater.

Grokett's JACE group and other ham organizations have subsidized seven OSCARs (Orbiting Satellites Carrying Amateur Radio) over the years. AMSAT, an amateur satellite construction group, builds them, and the space shuttle launches them. Anyone with a ham radio and a computer can use the satellites to communicate around the world.

Hams with computes can even listen in on NASA conversations on the space shuttle. The computer helps a radio antenna stay precisely focused on the shuttle as it zips through the athmosphere at 17,000 miles per hour.

SLOW SCAN

The next wave in ham computing is slow scan television. This lets computers send and receive color video pictures over the airwaves. Red, blue and green separations are made of each image (as in a photo negative) and each is sent individually over the airwaves, then reassembled by the computer into a complete picture.

Slow scan lives up to its name, however, at a sluggish eight seconds per picture transmission. (Regular television transmission speed is 30 pictures per secund.) The final image has about half the resolution of regular television.

The slow scan technique was used to send the first photographs of space back from the Pioneer--in fact an amateur radio enthusiast developed the technique for NASA back in 1958.

Hams have always been involved with experimental uses of radio, and the computer is bringing new levels of sophistication to the hobbyist. For example, McKirken is currently collaborating on the development of a commercial program that, when combined with an 850 interface and an

ST 980 Yaesu radio modem, will enable any Atari with 32K or more to take complete control of the radio.

The computer will turn the radio on and off, show a graphic s-meter (representation of signal strength) on the screen, and even push the mike to talk. Such programs enable the user to recieve and send messages even if they're not home, much the same way as a timer turns your lights on while you're on vacation.

And sometimes the computer is just used as a computer. When hams have contests to see how many countries and people they can reach in a given weekend, computers are used to sort out the mountains of resulting paperwork and compile statistics.

The computer is also used to set up parabolic bases that enable hams to pick up commercial satallite TV transmissions in their back yards.

About the only thing hams don't do with computers is play games--unless you consider the on-air radio chess network.

"The big thing about ham is it has always been and always will be amateur," says Crokett, who, when not operating his computer radio network works for AT&T. "It's not allowed to become a profit-making thing," he says.

FOR MORE HELP

If you're interested in getting started in ham computing, here are some places to consult for more information :

American Radio Relay League
This 66-year-old, 100,000-member, worldwide organization is the premier resource for anyone interested in getting involved with computer-aided amateur radio. ARRL publishes a monthly magazine, is involved with ham education and keeps an eye on FCC regulations:

ARRL
225 Main Street
Newington, Conn. 06111
(203) 666-1541.

Atari Microcomputer Network
This Atari-and-radio users organization is reorganizing after a period of inactivity. They used to publish the Astra newsletter and offered a selection of public domain software. For information or advice, drop in on their international, on-the-air meeting--Sundays at 1600 Universal Coordinated Time (UTC) on frequency 14.325 MHz.

HAMNET
The CompuServe ham radio special interest group welcomes your questions. Just type in GO HAM II after you have logged onto CompuServe.

RTTY Today
This book is a good reference source for beginners and is available for $8.95 plus $1.75 postage from:
Universal Electronics
4555 Groves Road, Suite 13
Columbus, OH 43232
(614) 866-4605.

JACE
The Jacksonville, Florida Atari user's group is a good source of public domain ham software. Out-of-state members are invited, Call their 24-hour BBS (FOREM 300/1200 baud) at (904) 733-4515. The sysop is a ham who may be able to answer your questions. Or write: Russell Grokett, 1187 Dunbar Court. Orange Park, FL 32073

Computers and Amateur Radio
This bi-monthly newsletter about using amateur radio with personal computers costs $6 a year:
Kantronics
1202 E. 23rd Street
Lawrence, Kansas 66044
(913) 842-7745

So much for hoping :)

I cut the output (right hand) lead of the 7812 and checked the
resistance on both sides of the cut. The 7812 side reads about 80 Ohms,
and the pcb side reads zero.

So, those 4-5 parts on the pcb you mentioned...? ;)

I also checked the input voltage on the 7812 with the output leg cut,
and it seems to be slightly above 20V.

I suppose this puts us back to square one with these other 4-5
components (I hope it is one of those!)

Once again, thanks for taking the time to help.

Ah, those wonderful programs in Machine Language ... written
in BASIC. Decimal DATA statements with a FOR loop to poke
them in. Even then they could have used encoding, dammit.
>
>Besides, typing in BASIC programs was more fun, it taught me to program.
>I remember my dad typed in one such program, and changed one PRINT
>statement to read "STEVE'S REVENGE" instead of the original title, which
>also had "REVENGE" in it.

The only problem was that text adventures are given away if you
type them in (unless they ROT-13 the DATA statements, but not
many people thought of that.) I too have fond memories of my
Dad modifying the code to the CURSOR games to personalize them.
The monsters in DUNGEON! were Kevins, Scotts and Choppers rather
than Ogres, Wyverns and I-forget-what. Hmmmm, I wonder what he
meant by that.

>Then again, you could print your own backups and have no need to spend
>a thousand bucks on a floppy drive.

I AM NOT MAKING THIS UP: one issue of the Transactor had an
article on holography using a dot matrix printer. Yes,
holography. Included code for printing out a pattern on your
paper, which you could then photoreduce onto film and shine
a laser through.

That was utterly irrelevant, but I completely forgot about it
for the last decade or so, until just now when you mentioned
printing out backups. *wail*

Well, that is good news. I mean the quick and dirty method of testing
probably saved 30 minutes or so and $1.50 for a new 7812.

> and the pcb side reads zero.

This absolutely bites.
>

> So, those 4-5 parts on the pcb you mentioned...? ;)

Dynamite. I would expect it to go that high under no load conditions. i.e. 7812 had a leg cut.
>
> I suppose this puts us back to square one with these other 4-5
> components (I hope it is one of those!)

I'm looking at the schematic right now and asking myself "Why did they do things like this?" Probably some engineering thing that only an engineer would understand.

They have 4 low value caps on the output side of the 7812 that could have shorted. These are C70, C43, C42, 47 micro Frarad and C21 4.7 micro Farad.

C70, C43, and C42 are just forward of the TIP110 transistor mounted on the heat sink.

C21 is mounted near the front of the board next to a RCA CA3086 transistor array.

As far as I can see, the only chips that have 12V being fed directly into it w/o having a low value current limiting resistor <~47 Ohm> are the U22 MC1733CP, U23 NE592, U24 CA311, chips. Kind of skeptical it could be one of the, I mean the CA311 is just a little 8 pin dip/op amp thing. Putting 30 watts through that if it failed would have made it glow like a xmas tree bulb.

First thing is to check the little caps I just mentioned for puffs. Maybe hold the PC board up to a bright light and look for signs of browning fiberglass resin around the chips/caps I just mentioned.

For ref, the area around the diodes in the voltage doubling circuits is likely to be a taffy brown and that is the only place you should see that condition on the board if they were mounted directly on the board vs ~1/2" above it.

It is kind of risky, you will burn your finger for sure, but another "If it was my thumb" kind of thing. I would plug a good transformer back in after fixing the snipped leg of the 7812 and check each of the chips. Just moisten a finger so you don't completely brand yourself and lightly touch the chips. If there is a hot one, that is your culprit.

Thanks, Mathy. Your explainations will be very helpful in finding the causes of the various bugs you've run into.

The main problem with the 'smart' cartridge aproach and the pass thru idea (SDX clone) is that there does not exist supplies of such a board or a case to hold one.

The MEM.SAV file is being created by the RAMBOOT program, and sould have been an option from the very beginning. A good rewrite will fix that.

MyDOS does use file numbers for double density BTW, its only when MyDOS uses more than one VTOC sector (enhanced, large ramdisks, and hard drives) that MyDOS drops the file number scheme. Its the total sector count that determines if file numbers are used (type 2) or not (type 3). But sorting on screen is an Idea that never occured to me, and its an interesting one for sure.

The 64 file maximum is a tough nut to crack, but your approach just might work. I'll be thinking of a method that makes the most sense to employ.

What I'm afraid of is that if I or someone else comes up with such a version, the memlo will be so high as to be unusable for a large portion of programs or games. I think that $2000 is the limit for this 'maximum' memlo and MyDOS is so close to that already, I fear that other than bug fixing, little can be done to this otherwise surperb DOS. Still, yours and others ideas are all very interesting to think about. I'll let you all know if I can grind out a better Ramdisk.com for MyDOS as a starting project. Thanks.

I had a few old Atari 8-bit software and hardware forsale. E-mail me if you
wish to purchase or if you have any question on the items forsale at
gp429@aol.com --thanx
FOR BOTH 1 & 2 $25
1) Flight Simulator II by subLOGIC
This is complete with the box, manuals and the maps. PRICE $12
2) AtariWriter w/Atari Proofreader Program and Dictionary by Atari
Includes the AtariWriter manual, cart. and quick reference sheet. I do not have
the manual for the Proofreader and I will also send a copy of DOS II. PRICE
$15
---Hardware--- BOTH $8
Atari 1010 cassette drive
--not sure if it works included is the power supply, data cable and
Conversational French program with workbook, PRICE $5
Atari 1027 daisy wheel printer
--not sure if it works included is the power supply & data cable, PRICE $5
The entire lot $30!

646. Atari 1450XLD Disk Controller ROM's

Source record: 39170

Hi,

In the Atari 1450XLD section of the Atari History Site, there are now ROM images of all the various versions of disk controllers ROM's for all the various versions of controller boards, daughterboards and the Atari 1450XLD TONG motherboard.

Hopefully these ROM's will be of use to someone wanting to learning more about the Atari 1450XLD architecture and also to want to build a PBI version disk drive.

Also for more info, schematics and technical data on the 1450XLD, check out Glenns Showroom: http://www.geocities.com/glenn_b18/

Wait... that didn't happen to be an April issue, right? One April
issue of the German 64er had an article about printing on easter eggs
with a dot matrix.

Sorry for the delay in response...
I tried the one you posted from computer shopper and it works great.
Just one thing though, I'd like to customize it a little and I'm not
sure I understand the coding, If it is not ATASCII then what? I've
compared the program to my charts and I can't see any corolation
between character codes and the program. More specifically, I'd like to
change the period to a comma, the escape to a 'd',the no to a 'a', and
the yes to a 't'. That way I can type in DATA statements from program
books without hunching over the keyboard. Thanks again!

I had this deal with my mom: I would do the dishes, and then she would dictate hexadecimal to me for half an hour every night after dinner. Went through many an issue of Nibble that way.

One evening, she was dictating something like "A9 B1 20 ED F0" and I interrupted her and asked her if she meant "FD" instead. She said "Um... yes... but how did you know?"

(On an Apple II, 20 ED FD is JSR COUT, the usual way of outputting a character to the screen.)

Basic I did myself, because I couldn't work out a robust voice encoding of punctuation that was Mom-friendly.

Paul

651. 130xe Ram upgrade

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-24 10:57:47 UTC
From: "David\\Julie Wilson" <cybrslider@home.com>
Message-ID: <Lyyb6.29480$bb.762868@news1.rdc1.tx.home.com>
Source record: 39175

Hi all.

My 800XL has become just to darn flaky to use anymore. I have to boot it about 10 or 15 times before it will completely boot and then it makes my monitor roll for about 15 minutes until it gets warmed up. After that it seems fine but, I would hate for it to fry my BB or something else. So, I dug out the 130xe that I bought new about 10 or so years ago. I haven't used it but for about an hour or so in the past because I hate the freakin' keyboard!

My 800XL had a 256k Rambo upgrade, and with Sparta X, I had about 35k to program with. With the 130xe, I can't get but about 30 or 31k. I've got the config.sys to use banked for the X cart, just as I did with the 800XL. With the 800XL I had a 440k ramdisk and still had some extra ram to play around with programming. With the 130xe the default for the ramdrive with the X cart is no ramdrive and I have it set that way but still only get the 30 to 31k. The config.sys I'm using is:

```
DEVICE SPARTA BANKED 4 5
DEVICE SIO
DEVICE ATARIDOS
DEVICE JIFFY
SET CAR=B:CAR.SAV
SET BASIC=B:BAS.SAV
SET PATH= ;CAR:;A:>;B:>;C:>
SET PROMPT=$L:$P>
```

I guess this would really be better for compatibility with other systems if I were to put anything I program out there for other users to utilize. If I recall, with Dos 2.5, I had about 32k. But for my own use, I would really like to have the extra 3 or 4k back. I have lost the X cart manual, and the one on the 'net doesn't have the chapter on the DEVICE's listed yet. Anyone have any ideas what setting changes I could make to regain the 'lost' ram?

That brings me to my next question. How hard is it to upgrade the 130xe to 320k ram or more? On one 'net site it stated that you just have to replace the 4x64 chips with 4x256 chips to get to 320k. Is that true? Any clues on where I would get 4x256 ram chips? The fact the ram chips are soldered to the motherboard coupled with the fact that I haven't soldered or de-soldered anything for about 10 years really sucks.

Howdy (do you have a name?)

>The main problem with the 'smart' cartridge aproach and the pass thru
>idea (SDX clone) is that there does not exist supplies of such a board
>or a case to hold one.

But it can keep memlo very low. And a pass thrue cart shouldn't to too hard to build. Problem is, who's got the rights? And are these the rights to the design of the case, or the idea? In other words, if we redesign the cases, are we allowed to build our own.

What I forgot to mention is that sometimes when copying (but it hasn't happened in years, so maybe it's limited to floppy drives or to one-floppy drive systems) without extender, that MyDOS will add an extender. I have NO clue where it gets the characters it than uses as extenders, but they are 'normal' characters, a-z.

I assume you've already pulled and reseated all the socketed chips on the
mother board.

You may want to try replacing the RAM chips one by one. You will be able to
check them with either a 64kx1 or 256kx1 chip. I've had problems like you
describe with a badly done upgrade before: One of the pins on a RAM folded
under and kind of looked like a 'J'. It made good'nuff contact that the
machine mostly worked, but the failure mode was a lot like you describe.

Other 'biggie' failure is if you have a processor that is Made in Mexico.

I believe all 130XE's came w/o socketed RAM. That means you will either be
piggybacking chips or removing 8 RAM chips from the mother board. Maybe just
me, but I don't consider that a trivial exercise.

I have heard of some Atari computers other then the 600XL that used 4x
chips, but all the 130XEs I have seen usee 2 banks<8 chips/bank> of 64kx1
DRAMs.

ROTFL... Boy this brings back memories. I remember when I too could look at 6502 hex machine code and automatically convert it to assembly in my head. And yes, the common entry points would automatically translate as well. I looked at this sequence and though "Load A register with $B1, print it on the screen". Wow, major flashback. I can't for the life of me remember what character that is though. :)

Just _had_ to look it up in the ASCII chart in the old Epson manual. It is the number one "1". Now, was that Flashing or inverse or normal???

Maybe it's time MyDOS went under the OS ROM. It would solve your memory problem. 400/800 use wouldn't be an issue either, since those machines don't (generally) come with hard drives.

Can anybody tell me if the "Atari800Win" project is still ongoing or if the "Atari800Win Plus" emulator has taken over ? Or do I need to keep up to date with both emulators now ?

Thanks,

Richard.

I JUST MIGHT still have the issue at home, but I won't be back
in IL until march. It's not likely to be a prank; the
Transactor's idea of an April fools' prank would be printing
an issue that was 98% advertising free instead of 99%
advertising free. Or not hiding a cartoon dog on the front
cover.

> heat
> > in the drive. (?) Any other likely motives for their using the DC supply?
I'll make another guess. They wanted to avoid interference (hum) in the
drive
and placed all the AC circuitry outside. This is very overkill, but
maybe
an audio design guy worked at INDUS.

> > Third part: I have read that any unfiltered AC (ripple) voltage is bad.
> Yet
> > (virtually) no one went to the trouble to add things like Zenier diode(s)

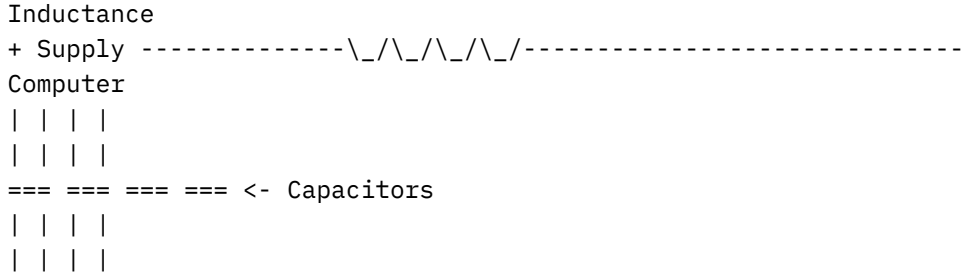
> of ripple in power supplies. I guess everything ripples in sync so as my
> 6502 drops from 5.25V to 4.5V, so does my POKEY.
The chips generally are specified between 5.25 and 4.75 volts. So the
ripple
should not be larger than this. In addition there are inductances and
resistances
on the board (the copper lines) which will make the voltage drop a
little
bit extra, which leaves less margin for ripple.

The obvious way to get rid of ripple is filtering. A large capacitor
does this
fairly well. If you want to get a really clean DC you can do something
like this



- Supply ----------

The Capacitors should be one large and on small on each side of the inductance.
The capacitors and the inductance forma a pi filter that filters the AC component.
The reason to have a small capacitor together with a small one is that the large
capacitors does not handle high frequencies well, but the small ons does handle these
better.

/Olav

> Went through many an issue of Nibble that way.

The 64'er magazine had a system that encoded hex code into
strings that used all ascii chars plus a check sum.
With a special program (which I had to type in the hard way first),
you could type in these sequences without looking to the screen.
If you made a mistake, you would hear a sound if it detected
that the checksum didn't match.
I typed in a complete macro assembler this way, I think it was about
three pages of 4 columns each with the strings in a very tiny script.
It took me days to finish it.
And although it had the checksums, one mistake slipped through,
and I had to run through the whole thing again to find the mistake.

Luckily the internet became popular and we can download all
those wonderfull programs in a blink!

Northern Illinois University had a very assembler-centric program,
using the IBM 360 mainframe architecture. You could satisfy all the
coursework for a BS using only a tvi910+ terminal and VM/CMS.
This is, like, 1995. And it's probably still they same today, tho
they replaced all the tvi910s with PCs emulating tvi910s.

Anyways, the final OS course required such insane familiarity with hex
that my officemate, given a TA job for the intro assembler course, was
worshipped and feared like a volcano god. Students would come to him
with printouts of programs that were abending, and he'd flip past the
assembler source to the hex dump. This was *easier* for him, because
you wouldn't be fooled by mistyped instructions like "LA R5,R1"
instead of "LR R5,R1."

Figuring out where and how you were ABENDing by looking at a page
of hex was, to the uninitiated, like predicting the outcome of the
next Superbowl by staring at static on your TV.

Source record: 39189

Yes, I pulled all of the chips and reseated them all. No help there. I don't have any extra 1x256K chips to try to replace them one at a time. I guess I could try the old 1x64k chips that were replaced when the Rambo upgrade was installed to see if that improves the situation any.

I don't know where the processor was made. It doesn't have a 'made in' stamp on it. Just a part number. All the other 'big' chips were made in Japan or Korea.

I popped the case on the 130xe last night and it has 4 ram chips. 4464 is the part of the number on 'em.

You are correct in that the ram chips are soldered to the main board of the 130xe. Actually, 2 are and 2 aren't. At least, I think their not. They are higher above the main board than the other 2 chips and appear to be installed in some kind of metal tubes which in turn are soldered to the main board.

I don't believe removing chips that are soldered to the main board a trivial exercise either. I pretty much don't want to even attempt it at this point because the 130xe and the 800XL are the only two 8 bit's I've got left. One ain't working so good and if I try to de-solder the 130xe and mess it up, I'm without a for sure good machine.

Thanks for your input. I believe I'll try the old 64k chips in the 800XL and see what happens.

Base-64 ??? Fortunately not ALL ASCII characters are used,
only most of the printable ones... :-)

OTOH even without the Internet, there are now scanners and OCR
software which almost has made printed paper a machine-readable
format.

Source record: 39191

I have an old Atari 800 system, with an 810 and 1050 disk drive,
interface,
and a slewof old sisks. I'd really like to transfer the contents of the
disks--
old Atariwriter and ASCII files, actualy-- to my PC.

I'd heard that Xformer would allow me to hitch an 810 disk drive to my
PC, but
I've been unable to find a source for a cable.

Are there any Atari users out there who might be able to help me in
this?

It's somewhat good typing practice, or at least BASIC programs were. Typing
in hex dumps is a bit different, but it was faster (for me, anyway) than
typing in the source code and assembling it. (You also didn't have to
translate the printed pseudo-ops into the (usually different) pseudo-ops
used by your assembler.)

>> At the very least I'm surprised that COMPUTE! and etc didn't print

>
>If I'm not mistaken, the Atari magazines weren't so smart. They had
>us type in decimal, meaning three keystrokes per byte.

Hex with a checksum per line and for the whole file was typical for Apple II
magazines. Nibble had two ways to go: a free checker published in every
issue that checked each line as you typed it, or an editor you could buy
from them that would check an entire program in one shot. Me being the
cheapskate I was, I rigged their free checker so it would check whole
programs. I sent it to them, but they weren't interested (gee, I wonder why
:-)). That hacked version has been useful for scanning/OCRing
programs...first time I tried that was in 1989 on a Mac IIx with an Apple

Scanner and OmniPage (or its predecessor if it had a different name back then), and it worked fairly well at weeding out OCR errors. (I really ought to scan in my Nibble collection sometime...paper doesn't last forever.)

>And as for an optical magazine- program scanner, I'd like to see someone
>design such a thing such that it would be easy to make, or mass-produce at
>reasonable prices, in the 80's. Because if it was possible, it's
>completely stupid that they didn't do it.

There was such a device, the Cauzin Softstrip reader. It was available for the Apple II, Mac, and x86 boxen, and a few magazines published some of their programs with it. (You could also print your own strips to make a "dead-tree backup" of your files.) It never really caught on, though. It wasn't too outrageously priced (under $200 IIRC), but I suspect that the market of people entering their software from magazines wasn't big enough to support it.

Having just used both a800win 2.7 & 2.7b, I am having a prob with the roms, If I boot without an image (disk) and basic is disabled, and i select memory test from the self test screen, everything is ok, but if i then install or load in a disk image, and later cold or warm boot the emulator it will jump to self test, and if you run the mem test the rom shows up as red (bad rom), I got the roms (xl,osb,5200 etc) from the links in david firths site (programmer of a800win), is there any reason for this or am i doing something or, or is there a bug in a800win that prevents the roms workinmg properly, I am also having a problem in using the omnimon rom image and qmeg rom images in a800win 2.7b
Does anyone know where i can get a rom image of the osa version of a800 o/s

I have this strange feeling we're backtracking right back to where we started out :)

I fixed the 7812 and checked the 4 caps for puffiness - they look pretty much as I imagine capacitors should, so I doubt if it's them. The chips look ok and don't seem to even warm up when power is applied.

So I looked at the board, and the only place I can see any signs of heat are round the two diodes nestled among the 3 big caps at the back (CR15 and CR16) With power applied, and a licked fingertip, the lead into CR15 is hot enough (within seconds) to make an audible hiss as the saliva (and then my fingertip - you were right about getting branded!!) boiled away!

Now, does that sound like CR15 & 16 are the problem? They both give a different resistance when measured in both directions - swapping +ve & -ve probe - but boy were they hot!! My fingertip is still stinging ten minutes later!! :) Or does it point to some other possible cause?

1st you should get Typer's Toolbox from early Antic (
http://www.atarimagazines.com/); it has a DATA mode which does the line numbering and the "DATA" and the commas - you just type numbers and Return. I even added their checksum routine to mine eventually.
2nd The conversion table is 18 bytes beginning with the "52" & "24" around line 270-280-290 through the "155"; it is raw hardware key codes from the OS Manual. They can be redefined in the data statements;

52,24,29,27,35,51,53,48,43,31,30,26,50,34,12,14,28,155
del 4 5 6 N 7 8 9 Y 1 2 3 0 . ret - esc

The best and only thorough treatment I have seen on the internal keycode system was in Compute!'s 3rd Book of Atari.

D is 58 replace the 28
A is 63 " 35
T is 45 " 43
comma is 32 " 34
> chainsaw11 chainsaw11@my-deja.com replied:

I would expect them to be hot since there appears to be a dead short on the output circuitry of the 7812. The seemed to be working fine when you cut off the output leg of the 7812 anyway.

I hope you feel comfortable with pulling a few parts to isolate the short. I will try to really keep it simple. Start by pulling L6, the inductor right by the jumpers/heat sink and measure the resistance from the both solder pads and the output of the 7812 to ground.

If the 7812 output goes to ~6k or so and one side of the former 'home' of the inductor pads <not a real reading but what I see while the caps and stuff charge to the resistance testing voltage of my DVM> then it is the TIP110.

If it doesn't, look for inductor L4 up by the front of the board, next to the CA3086. Same basic procedure.

Since all the chips are running cool, I don't think it could be one of them. If they were blown, they would have been as hot as the power diodes. I mean a 30 watt soldering iron is pretty hefty. It's got to be a part that is capable of sinking one hell of a lot of current w/o glowing red. That kind of leads me to suspect the TIP agains, maybe a genuine short like a lead or solder goober, or maybe a shorted cap.

>with both emulators now ?
>
Rich who writes Atari800win does still update it but less so these
days, time is a premium for him so who knows when / if he will get
time to work on it.

The plus project isn't a takeover, its a separate project based on the
source code of Atari800win. Personally I keep both upto date but its
more likely you will see newer updates from the excellent Plus
project.

Maybe Rich will answer this himself?

The 64k chips produced the same result. I put the 256K chips back in and the results were worse. I ran a program that checks for extra ram and reports how much memory the machine has. First run it said 576K. Second run it said 256K. Then it locked up. When I pushed reset, it went into self test mode. But not the normal way, it went right into the memory test. It tested about 34K, then cycled back to the beginning of the test, tested 34k again and cycled back. I turned it off at that point. I have another 800XL in storage somewhere. I think it doesn't have socketed chips though. But, at least it has a decent keyboard. That is, if it still works.

It was great actually giving you information!

Thanks again for your input.

Hi,
I have a Personal Peripherals Super Sketch pad complete in box
with the owners manual, warranty card, Sketch Pad, Cartridge, and
starter sketch packet. Can anyone give me information on it? From
what I have found, one site stated it was "extremely rare". Can anyone
help?

Thanks!

I have the CP/M...but it is on a 8 inch floppy (Yes, that is what I said, an eight inch floppy). Getting it onto another medium might be completely imposible. I still have an old 8 inch driver around here someplace. If nobody has anything that is more easily used, I can try to get that set up again. Also, on 8 inch floppies, I have the bios source and the source for the ATR rom. These are all original SWP disks.

c64@fiberia.com:

>The 64'er magazine had a system that encoded hex code into
>strings that used all ascii chars plus a check sum.

Oh, yeah, that system was extremely horrible. The one before was easier
(since it used hex code), but I guess they changed to get more compact.
Anyway, since it beeped when one entered incorrectly, and I had my C64
connected to the stereo, I switched on a TV program and typed, and
everytime I heard a beep, I just pressed DEL enough to remove the line,
and started over. I entered a number of programs from 64'er watching
TV...

>Luckily the internet became popular and we can download all
>those wonderfull programs in a blink!

It's withed mixed feelings I see this happen; it's nice not having to
type things in, but, on the other hand, you don't get the same direct
contact with source code any more. Like all the BASIC programs I
entered from magazines, they learnt out quite a bit of programming
techniques, and since I typed them in, I learnt them.

Michael Black:

>There were also some attempts to distribute programs over the radio.

There has also been programs transmitted via TV, both terrestial and satellite. The German TV show ComputerClub on WDR started it, and then later a commercial company called Channel Videodat formed, transmitting over another German channel. They had a fixed schedule, and transmitted programs, news, and "online" magazines via satellite.

The problem was that since we lived in Sweden, we needed to get it via satellite, and that wasn't as reliable as one would've hoped, so we didn't always get the programs we set it to receive.

(This is a bit off-topic, since they didn't transmit C64 programs, they *did* however, at a time, transmit Amiga programs, but later went PC only).

Source record: 39108

The more you put in the XL like ram and other modifiecations the more amps
you need or the system will not boot.. Try a new power pack or make by
pulling one from an old IBM unit..
The IBM Power packs have Plenty of amps.. use a multitester to find the
5volts line (red) and ground (black)
and use the cord from an old Atari power pack. On the Atari cord there 2
lines 5volts and ground, the 5 volts has a white line on it.. Now
after its all done .. turn on the Atari first then the IBM power pack

Im able to boot my XL with 1 meg ramdisk, 512k ramdisk each with multi-os's
and Stereo upgrades and they last forever.. I too had the problem you are
having and it was the power.

Good Luck

If so
> how?
>
Tom,
You need a blank cartridge that is made for eproms. The production
carts from atari will not work with an eprom. There is something about
the lines. One is high when it should be low or something to that
effect. I have done it, and have a blank cart made for eproms. It holds
2716's I believe. I did manage to write a simple machine language
program that wrote my name to the screen. I burned it onto the eprom,
plugged it into the eprom cart and then plugged it in, and it worked.
One day I would love to write my own game on a cart.

I think that some people have the blanks for use with eproms. If anyone
knows of a good supply, I would like to buy a couple myself. Or if
someone would post how to modify the production carts to use eproms, I
would appreciate that also.
Good luck with it Tom.

Yeah, Lee will work.:) No one can claim any rights to the pass thru idea. That would have to be in a patent that has run out (17 years max). Same for design patent on case if one could even be issued. Real problem is money. I don't know about you, but I don't have a couple thousand to gamble away on such a project. And to what real end? SDX users claim it to 'be the best'. I've got it and rarely use it. I prefer MyDOS for compatability, stability, and it loads from hard drive faster than SDX can figure out what it wants to do at boot up. I guess it boils down to this - I don't see the pass thru cart as an answer to a question that's worthy - why?

You did mention that random extentsion popup bug. I've never seen it, I wonder if it was on an unstable machine?

Was their any significant enhanchments to 4.53/4 other than the 'numbered' .arx autorun.sys addition? I can't think of any, but I haven't yet found the good source code yet either. Thanks.

That's just what Sparta did and I think doing the same to MyDOS would be a big mistake. There is a surprizing number of programs and games that load in there and will not run with SpartaDOS. Moving the only other Double Density DOS for Atari machines under there leaves me cold. Just my opinion.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:
alt.binaries.atari
alt.binaries.atari.d
alt.binaries.comp.atari8bit
comp.emulators.misc

Howdy Lee, folks

>No one can claim any rights to the pass thru
>idea.

That's good to hear.

>SDX users claim it to 'be the best'.

That's the same thing Windows and PC users say about there stuff.

>I don't see the pass thru cart as
>an answer to a question that's worthy - why?

Because sometimes I really would like to have something. And a MyDOS smart card would be just that thing. We don't really need a case. But if we do, we have a plastics institute here at the university with the newest injection moulding machines. (They have lots of visitors, and the manufacturors don't want these people to see old machines. :-))

>You did mention that random extentsion popup bug. I've never seen it,
>I wonder if it was on an unstable machine?

Not that I know of.

>Was their any significant enhanchments to 4.53/4 other than
>the 'numbered' .arx autorun.sys addition? I can't think of any, but I
>haven't yet found the good source code yet either. Thanks.

I never use MyDOS 4.53/4, I always use /3. The only difference between the two is that /4 is fixed at a minimum of 4 digits in the sectorcount. There should be a note with the 4.53/3 code on what was changed. I can send it to you if you want (remind me, I forget stuff like that). But the .arx thing has got to stay!!!!!!!!

Howdy Jeff, folks

>Maybe it's time MyDOS went under the OS ROM. It would solve your memory
>problem. 400/800 use wouldn't be an issue either, since those machines don't
>(generally) come with hard drives.

That would make it impossible to use TurboBASIC. I don't use it that often,
but...

There is/was a version of MyDOS that went under the OS ROM, IIRC it was version
3.016 (Charles Marslett, the original author, told me years ago).

CU Mathy van Nisselroy

PS but it could be hidden underneath BASIC or ACTION! or MAC65 too. (if you'ld
want that)

Hello,

I dont remember exactly - was MyDos split in a DOS and a DUP part ?

> card would be just that thing.

The advantage of a cartridge is, that it is always present with only
small consumption of convetional memory.
But there are some disadvantages, too.
- this means the development of hardware and hardware is expensive in
production and shipping ...
- you have to use FLASH-technology to make it easily upgradeable
...

Why not using some of the extended 130XE memory ? I am wondering, why
there is only such a small number of software (beside demos) using this
memory.
The main problem is that there are so much extensions out there, every
program has to check out, what pages are usable and then it takes the
one, you have your RAMDISK installed in :-(.
So it would be nice, to implement some memory-management:
The DOS would check the available pages and every compatible program
will get a page on request.
Any serious Atari-users out there without a 130XE-compatible memory
extension ?

Bye,

Matt

> contact with source code any more.

I see your point. I learned most of my BASIC programming skills from typing in programs. Not that I recall finishing one, that is.. Most of the time, I lost interest halfway down.

I had a couple of type-in-game books, which had an explanation of the source code alongside with it. I learned quite a bit of it (still do, actually, but not with BASIC anymore).

However, this doesn't stand with these HEX dumps, unless you know the opcodes by heart. I still don't (and I don't really feel myself inclined to learning them). In that case, the hex code (or even worse: the decimal BASIC-loaders!) doesn't make much sense - it's just a bunch of seemingly random numbers, then. This gets even worse with a more 'advanced' encoding of data using half the ASCII set. I don't think many people have learned anything from that.

Oh, the blissful days when I thought that writing a nice game only required one to enter "10 sys 2051". The satisfaction I got when this actually worked once, after I had just pressed reset.

Sadly, this includes the disgrace that my newly-found programming knowledge didn't quite work out on my friends C64..

Mostly right, but if you get lucky there are a number of 'official' Atari carts that had a 28 pin mask ROM that work with 2764 EPROM, socketed too.

With all the ones I have seen, they take out the full 16k of cart address space even if they are only 8k carts.

I ate a bunch of Galaxian carts for experimenting: Did stuff like snipping copper traces to get the thing back to only 8k bite and burning a revision C BASIC. I also converted my old flaky ASM/ED cart from the 2 chip<2532?> version into a contiguous file that worked with the hacked Galaxian cart.

Every rev C BASIC cart I have seen uses the 24 pin ROM soldered directly to the board and a lot of the early stuff used two 4k ROMs.

I would guess the window for DOM where Atari was using the socketed 28 pin carts was probably only ~1983-1985.
<snip>
> I think that some people have the blanks for use with eproms. If anyone
> knows of a good supply, I would like to buy a couple myself. Or if

> would appreciate that also.
> Good luck with it Tom.

I had multiple chances to buy sheets of cart PC boards for a couple of bucks and mostly passed it up. I did buy a few for maybe $2-$6 each. When they finally dumped the rest of the production, they were something like 8"x10" sheets of them for a couple of bucks each that you snapped apart like like saltine crackers.

IMHO: I've always liked carts, they fit in perfectly with a family computer where you need to have something a 5 year old could operate. I don't think it will fit with most of the current crowd for anything other then as a

hobby. We're getting old, kids grown, that kind of stuff.

699. Is Steven J Tucker on line?

Hi Everybody!

I have a question for you.

A long time ago I sent an e-mail to APE's creator, Steven J Tucker
(classics@nacs.net).
No answer yet.
A couple of weeks ago, I sent him another e-mail. But guess what, no
answer yet!

Does anybody know if he replies the e-mails people send him?

He's got a for sale/trade section in his APE homepage.
I'm interested in buying some stuff from him, but don't know if
he is really interested in selling/trading Atari items...

Any information, please send it to lbaeza@yahoo.com or post it right
here!

Thanks for reading this.

Regards!

Dr. von Byte

PD: BTW, I use APE for Windows, and it's a great tool for my Atari!
Also, building the APE cable wasn't too difficult!

705. SWAP: 800XL system for luggable 286

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-25 16:14:14 UTC
From: Richard Kilpatrick <richard@lovecraft.demon.co.uk>
Message-ID: <GbE3wSNWDFc6EwB0@lovecraft.demon.co.uk>
Source record: 39128

Seriously! For music stuff, I need a luggable 80286 or 80386 based system. It /must/ have ISA slots, ideally a gas-plasma display, and a 3.5" floppy drive. Doesn't matter about RAM, but 1Mb/20Mb HD would be the ideal minimum spec. Toshiba preferred, or one of those upright lunchbox designs. A bonus would be an MPU-401 MIDI interface, or something 100% compatible.

In return, you get 2 800XLs, one 256K model and one with a stereo sound mod, 1 65XE, 1 1050 disk drive, one XEP-80, some disks if you want them, and a beaten up Commodore 1084 monitor if you come and collect, though it doesn't really work for a long time ;)

(In case you're wondering, I'm hanging onto one 800XL to play Rescue on Fractalus. For a good laptop, I'll part with my other 1050 drive, though, giving you two drives).

Richard

> starter sketch packet. Can anyone give me information on it?

This product was meant to be a cheaper alternative to touch pads
like Koala, Atari Touch Tablet etc. Touch pads require hundreds of
micro-switches under the pad to sense your stylus/finger. Super Sketch
uses an drawing arm as input and sold for about half the price.
Unfortunately, it came out in 1984 when everything was collapsing.
Rarity? Maybe a 6 or 7 out of 10 for the cart. Hard to find, but
not impossible. I've seen a vendor (Ben Smith?) have the package for
sale at around $35-40 for a MIB.

News item:

Cin'tari, the Atari users club for the Cincinnati area, has been revived as a club on Yahoo. Former members of the club can sign up by going to "www dot yahoo dot com" and searching the club list for "Cintari." (Registration with Yahoo is required.)

In only one week of existence a dozen Atarians have already joined the Yahoo club and over 50 messages have been posted. The atmosphere is reminiscent of the Atari-based BBSes that existed in the good ol' days of the 1980s. (If this works out over the long term, it might serve as a useful precedent for Atarians in other places where clubs have disappeared!)

709. Eastern Front Comments

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-25 19:26:32 UTC
From: DCM01@USA.NET
Message-ID: <3a707baf.17746453@news.CIS.DFN.DE>
Source record: 39132

I recently acquired an Eastern Front cartridge and got into it a bit the past couple evenings. Crawford did quite a job on it and it deserves its acknowledgement as a true classic. It is particularly impressive with the detailed map and placenames etc. The nice map adds a quality to the game that would surely be missing in a blocky or poorly illustrated game, such as Avalon Hill's Guns of Fort Defiance.

If anyone knows where I might obtain instructions for Eastern Front please let me know. I websearched all over for them but can't find them on the Internet.

I specifically wondered if my strategy of occupying cities to cut off supplies to the Russian units was having an effect. Would also like to know if traveling theough squares adjacent to enemy troops exposes my units to damage and slows them down. Also the game will end on a certain date, but it hasn't really told me if I've won. Is there a way to "win," or is it just a question of capturing a bunch of cities.

I think I had a copy of that somewhere on the 800; never used much and never had any docs. Switched to 4.5 when I got the 256K XL with a Ramdisk. What exactly were the 3.016 capabilities?

Ok, I removed L6 (which appears to be a little blackened in the middle, around the area away from the pcb) and checked the resistance from each solder pad to the ground of the 7812 (centre pin) the resistance appears to be zero from both pads, and in fact, the resistance between the pads is zero, as is the resistance across the inductor (I was measuring everything by this stage!)

Then I tried removing L4. Looking from the front of the board, the resistance between the left hand solder pad and the centre pin of the 7812 is about 60 Ohms, and between the right hand solder pad and 7812 ground is zero. The resistance between the two solder pads of L4 is 500 Ohms, and the resistance across the inductor is zero (the inductors looked a bit like resistors, but are probably not related at all!!)

Is this pointing to a fault somewhere to the back of the board, round L6? What's next? start checking the caps?

(I didn't replace L6 before removing L4, does that make any difference?)

The good thing on the Plus-Project is, that no only the standard-hardware is emulated, but all the extensions hardware, like the dual-pokey (stereo) system or ATR-Diskimages up to 16MB (or more?). Or the ATARI-ST-Mouse...
One bug is still in this project: it capures no doubleclicks.

Sounds like turned pin chip sockets. These are about the best kind to
get. Question is, which bank are they on? easy way to find out is to
pull one out and turn the computer on. if it boots up fine, they are
not main memory and the upgrade will be eaiser.

As for the 800xl, I have seen mods on the memory chips from the
factory. A 100 ohm resistor was put into the dataline on each chip and
the track cut.
I have no idea why this was done.

Boy, that takes me back. My first comuter experience with computers
was with a TTY teletype machine; timeshared a PDP-8 (or was it a
PDP-11), 110 baud acoustical modem, one character at a time impact
printing, paper tape punch/reader. This is essentialy the machine you
see and hear briefly in"The Andromeda Strain". I wonder if anyone has
has TTY sound files available, or even a TTY (sound) emulator?

So, was there a paper tape punch/reader unit availabe and compatable
(or easily adaptable) with the C64?

Has anyone adapeted that CueCat thing and been able to read some of
those archaic barcode like data things?

> appears to be zero from both pads, and in fact, the resistance between
> the pads is zero, as is the resistance across the inductor (I was
> measuring everything by this stage!)

Inductors here are just for filtering noise. They should be zero resistance,
but good to know it isn't burned out.<yet>

This kind of has me puzzled, but then you probably guessed that by now. I'm
thinking pull the TIP110.

I am more following heat then anything else. L6 only supplies the TIP110 and
C43 is the only part between it and the TIP110. Those should be the only
parts that could short if my schematic is right, nothing else there.

Just that it should have been like cutting a trace. There should be normal
on one side and shorted condition on the other. Very strange this didn't
happen.

I would remove the RFI shielding over the drives processor/RAM/ROM just to
be on the safe side. Atari in their wisdom appear to have routed the 12 V
output from the 7812 all the way to the front of the board (L4) and back to
the transisor on the heat sink. Could be a mechanical short with the metal
shieldling.
>
> Then I tried removing L4. Looking from the front of the board, the

Recheck the L6 pads with L4 removed. It kind of goes
part part part<singular>
7812--|--L4-----|----L6---|--TIP110---- spindle motor
part part

hi,
i am addicted to the game for over 17 years.
occupying the cities lowers your in the hole points, the object is to lower the points as much as possible because invading russia is always a stupid idea, and the author has put your points in the hole to show you that it is impossible to go into the plus on points, you will notice a number with a minus sign next to it on your screen, that is the number to watch, it changes everytime after you make a move.
you must engage the russian troops to push as far into there territory as you can without getting cut off, watch out for the winter months, you will lose all of your troop strength, and you cannot win, so just entreanch your troops, and try not to get cut off, otherwise your troops will be eliminated.
also try and destroy as many russian units as possible, the best way is to blitz them in the opening move, then try, and surround them to cut them off so that they lose troop strengh.
to find out the troop streagnth just put the curser over a square, and push your joystick button,it will give you all of the units details.
the 1941 version is the hardest of the 2 games on board, do not let 1942 scare you, its actually easier if you blitz them hard enough in the right places on the line.
what the game is about is to show the futility of the whole eastern front, and what a waste of human beings it was.
there also was written a 1943, and a 1944, and also a scenario game, but they came on disk, and even as a dealer i was never able to get them in.
thanks,
lance

can use a
> wildcard to view the disk directory. It would be nice if you
could set
> it to automatically view the pictures, slideshow style.

Thanks
for the feedback, it is all appreciated. I agree with the need for a front
end, so that you don't have to type the filename in, and it is on my list of
things to do, although it might take a while as I'd like to get the colour
version working first.

A slideshow program would be quite easy to do, it
could automatically display all files with a .jpg extender on the disk. I
was just wondering if you (or anyone else) had any ideas on how to select the
display mode for the picture? One option would be to select the display mode
at the start and then let it display all images in that mode. Another would
be for the program to select the display mode randomly or circularly.

In
case anyone tried to download a copy of version 0.4 over the Xmas holidays
but couldn't get a working executable, there was a problem with Geocities
(where the executable was stored) adding some extra text to the end of files,
including binary files. This meant that the Atari executable got corrupted
when downloaded. I've fixed that problem by moving the pages to
http://rjespino.atari.org and http://rjespino.webhop.org

>Maybe it's time MyDOS went under the OS ROM<

I can't remember the details, but before the XL machines there was a "Ramrod" for the 800 that contained "RomDos" which I think was a version of MyDos. Note this was not the RamRod XL 3-way OS switcher.

Anybody remember the details of this?

Larry

Linux kernel 2.4 came out recently, and touts full USB support
(you could do it before, but it wasn't built-into the old 2.2.x Kernel).

Would a USB-based SIO2PC cable make sense? (My main reason for wanting to
use USB over serial port is I don't have ENOUGH serial ports! Also,
xfers between a digital camera, MP3 player, and PDA would be much faster.)

I pulled one of the chips and it booted fine. Everything worked just like it
was a stock 64k 800XL.

I have to say one thing in favor of the 130xe. The display on the Magnavox
monitor is much better than it was with the 800XL even when it was working
good. I suppose that's due to the fact that the XL doesn't do a separate
chroma signal.

Now, where can I get those 4x256 chips? Anyone know?

Thanks
David

When Paypal first started it was basically free, now from what I
understand they are charging a substantial fee. I've used Bidpay and it
seems okay, your buyer goes to www.bidpay.com and gives them all of
your info and all of their info and they use a credit card to buy a
money order online. They use western union, I'm not sure if they'll do
it for a non-auction sale though, you'll have to check.

Thats not a bad idea! It would really make sense for the 1050-2-pc
cable which requires an external power supply, USB carries voltage
doesn't it?

There was an Atari video game console (the 5200?) that was based on a stripped-down Atari 400/800 design. Its cartridges <might> be interoperable with 400/800 ones - although I wouldn't want to bet the health of my Atari 800 on it.

The 2600 and 7800 are definitely incompatible with the 400/800.

http://www.jdr.com has 256x4 ram chips, but I don't remember any upgrade using these chips. You'd be cutting new ground if you can pull it off. Bob Puff did a paper on the (8) 256x1 chip upgrade where you piggy back the new chips onto eight of the 'extended' memory chips on the mother board and then string pin one together and hook it in to the system with a logic chip somewhere (I forget exactly). Since this was on the XE system, I would think that paper would be the place to start such a project and then alter it to use (2) 256x4 chips instead. The paper used to be available on Puff's BBS, but I don't know if it is still up and running or not. Last time I tried, I couldn't get on, but the phone numbers were 716-247-7157 and 716-247-8355. Best of luck.

A lot of people use Paypal. I personally do not like them because I dont wish to give them my credit card and have this and that transaction going on there where I have limited control. I am sure that Paypal is taking a significant chunk of your profit there too.

It is also annoying how many Paypal users will bid on auctions specifying payment by money order, and then email that they wish to use Paypal, in express disregard of the auction terms. If such a person succeeds in getting me or you to register with Paypal then I think they get a payment of like $5.00 from Paypal, so what Paypal is doing is making a salesforce and providing incentive to these annoying people to make a habit of ignoring auction terms.

In one case a Paypal user just declined to pay me when I told him I wasn't going to use Paypal.

Not a bad idea. You may want to talk to some of the retailers that sell
this cable and see if they can come up with one. But really, how often do
you use this cable? I am in the same boat as you and do not have a large
number of serial ports, but I just unhook a device from one and the
SIO2ST(PC) cable.

You already mentione Toshiba so I assume you're familiar with the
6400/6600 family, but if you aren't that's what I would recommend.
They're about as close to indestructable as you can get for a computer in
a plastic housing. Toshiba had some earlier offerings (1100 or 1700?) in
a similar package but I'm not too familiar with them.

I don't know that the 5200 was stripped down.. The 5200 cart code will run directly on the A-8 computer! The 5200 games were actually a little nicer than the A-8 cart equivalents, because the 5200 carts had access to more address space. I think the 5200 carts could have up to 24K of code, while the A-8 could only use 16K.

As long as I'm on the subject, HOW incompatible are the A-8 and the 7800?
Look at ballblazer and a few other games, TELL me those aren't exact
copies of the A-8 versions. Now, I don't know how we could exploit this,
as the 7800 has a graphics chip that the A-8 lacks, but the hardware MUST
be closely related.

Paypal is still basically free, to the "occasional" user. I think the cutoff point is receiving over $100 a month, after that you have to pay paypal to recieve any more payments. I don't think I like that, because if you sell a single thing in excess of $100, you're stuck paying. I haven't hit that limit with my account, so I'm still using them.

I would rather say that BallBlazer wasn't written in a very portable way. It uses a lot of hardware tricks of the A800 to perform its task. For example, upwards/downwards scrolling is done by DLI-tricks, sidewards scrolling by using display list "on the fly" relocation. I've never seen the C64 version in real life, but I suspect that it must have been noticably slower. Not only due to the lower clock speed, but also due to the less powerful graphics engine.

So long,
Thomas

[cut here]
There is also a 400/800 version of TB and besides there is version 3.2q
from Tom Hunt for Sparta DOS users... But, besides Turbo-Basic there
are quite a lot of other programs that would not like a MyDOS under OS
ROM. I remember having (had) difficulties with Bibo-DOS (famous german
DOS version) and many programs for the same reason. At the moment I
merely remember TB, CTB Runtime, most Jeff Potter programs (Apacview,
Jview, Degasview, IFF/ILBM Read, Gifncode, etc.), but I am sure there
are a lot more programs (games, demos, tools/applications, etc.) which
would not work with MyDOS under the OS ROM. My suggestions: fix the
bugs, patch/enhance the format option (option I) to show all possible
disk drive formats (90k, 130k, 180k, 360k, 720k, 1440k) and write a new
Ramdiskdriver, but leave MyDOS in normal RAM area. -Andreas

P.S. Yep, I like that .AR? feature from version 4.53, it makes Thorsten
Karwoth`s MyDOS Batchfile enhancement almost unnescessary... And for a
file-copier + file-sorter there is TOMS Navigator (written for MyDOS
4.50!) or the MyDOS File-selector (from Bill Kendrick)...

Flash Technology ?!?
Well, we are currently producing (in co-operation with Stefan Dorndorf)
512k Flash-EpRoms for the A8. They can be used as a cartridge (plugged
into the cart-slot) and they are divided into 64k blocks. The first
block is reserved for the OS (drivers, boot-software,
file+sector-copiers, etc.), the remaining blocks are free for any other
software... -Andreas

What happened was they eliminated the 6520 PIA and used the POKEY chip to
read the controllers instead of a keyboard.

OS was major stripped down other then some pretty standard stuff like
character set, chips initialization. I think I may have had a disagreement
with someone about the OS. They said it was an 8k OS and I said it was only
4k or something like that. Been too long now.

Possibly not the best idea that ever came out of Atari Corpse.

>do people use PayPal enough to let potenial buyers to pay me via the PayPal system?<

I've only used PayPal as a Buyer, so I can only speak from that side. It is so much more convenient than having to go buy and mail a money order. Most sellers (that I've dealt with, anyway) don't want checks, so that leaves a m.o. as the next cheapest instrument (not counting sending cash as an option). Bid Pay is a $5.00+ money order -- heck with that! I'm getting ready to sell a few things to reclaim my garage from Atari's, C64's, and Apples, so I'm going to be facing this same issue from the seller's side. But just think how great eBay has been -- "stuff" you wanted to get rid of; "stuff" you wanted to buy, and some really good deals at times, too!
My .02,
Larry

Likewise. I have a 9-pin switchbox to switch from my PC external modem and my APE/SIO2PC cable. Of course If I wanted to use the modem and APE, I'd have a problem, but in 2 years, this hasn't come up.

Wow, this is great, I didn't know about this Plus project, just
downloaded it. The best thing is you can alter the color pallete, so
finally I can play Star Raiders with the proper blue shields and stars
instead of that awful green (uh oh, here we go again!).

I am constantly amazed with the excellence of these emulators.
Imagine that my PIII is also an Atari VCS, Apple II, Atari 800, Atari
ST and Amiga. It's like having the best of everything all in one box.
My endless thanks to all who work on these.

I've set up a simple DLI to put two colors in the background on a graphics 8 screen. Is there anyway to get rid of the annoying flicker with a DLI when doing disk operations?

Thanks,

Phil

Not tried this, but anyway here is my suggestion...

I think the flicker is due to a tight loop calling WSYNC in the disk
loading code. If you put the DLI a few scanlines higher and wait until
VCOUNT reaches the required value I reckon it will work.

Let me know if this works,

Mark

Right, I would have to review the docs as I havent' seen them in a decade,
but other then their not being a PIA chip, I think all but one of the other
chips was at the same address as in the 400/800 series.

They are so close in nature, I almost bet you could put a toggle switch in
an 800XL to switch it to a 5200 OS and memory map.

>
> > Possibly not the best idea that ever came out of Atari Corpse.
>
> They were a talented group, but forward thinking and market awareness was
> NOT their specialty.....

Thinking about it, I almost wonder if the 5200 was meant to be the 2600 VCS
replacement and was done before the XL series. Not necessarily when they
were released to the public, but someone doing a 2nd generation single board
6502 based replacement of the 2600 based on 400/800 parts, someone else
saying "Let's put the PIA back in and leave the keyboard, then call it a
1200XL".

> wasn't going to use Paypal.

Aw shucks, no fishies. They cast their rod elsewhere.

But hey, these same folks probably surf to click banners for pennies an hour.

Best thing to do with these people is get auction credit, and send lots of complaint email to eBay. "Not a registered user" for our pay "pal" appears soon.

An email eBay sent me a week ago (powersellers newsletter) had this damage control spin piece about Paypal being "investigated" by the BBB for too many customer complaints. I just laughed. Never used 'em. Never will.

They aren't that rare. I have about 200 left, new in shrinkwrap box. I also made a disk to convert from SSK format to Micro Illustrator, with a 4 gray print routine. I intend to do more updating of the software one of these days.

If you are going to use the ATR for the Atari, then you don't need either. Any A8 DOS and Software will work with the drives/printers attached according to it abilities. Modems do need the ATR handler, but I have found it to have a bug. MYDOS and Sparta DOS are recommended.

If you REALLY want to do CP/M with the ATR, I have it available for $6.00 for the 2 disk set. You must have at least 1 double sided dbl dens 5 1/4" drive on the ATR.I also have the ATR-SIG newsletter collection for $7.00. The CPMUG library(~'90) directory disks, and programs made to run on the ATR in the group library.

In your DLI, after your changes, use STA WSYNC to make the video wait until the beam is off the screen.
The value in A doesn't matter, WSYNC=54282. See Computes Mapping the Atari.

I too have only used Paypal as a buyer, and so far, if the seller is VERIFIED, then it works great. Its cheaper than having to buy a M.O.(Not from MY bank, but the Post Office), stamp, time,etc. I may oneday soon start to use it as a seller. Yea, they have my c card on file, but so do other places.

>
> jez.

I looked at the code, and found that there are several places where a subroutine is called, but in the subroutine, a goto is done instead of a return. This leaves bytes on the BASIC stack that dont go away. The best fix is to fix the code. The next best is at line 300, add at the beginning "POP:POP:". This forces two levels of returns/for nexts off of the stack and stop eating ram.

The Loader program could find a place to load the charset by looking at 106, and subtracting 4:POKE 106,PEEK(106)-4):GR.0". Peek(106) becomes the start of the chset:POKE 756,peek(106). This leaves the max ram available for room /program data.

You really cant complain if the auction says credit only then you have no choice. Its either pay by credit card or dont bid. There is nothing that says a seller has to take CASH. The seller can set the payment type. If he or she wants Pesos then you pay in Pesos. Its up to us bidders to read the fine print.

>
>
> An email eBay sent me a week ago (powersellers newsletter) had this damage

I use Paypal services all the time with out any problems. As for the BBB invetigating Paypal who really cares the BBB cant shut you down. The BBB only suggest to consumers what services to use and not to use. Ive seen businesses with 100s of complaints of file with the BBB and their still in business. Anyone could file a complaint with the BBB even if its petty.

If the flickering is the top, you need to install and immediate VBI to set
the color registers. They are set by the OS in a deferred VBI which
doesn't execute during I/O (when CRITIC flag is set). DLI's are still
executed during DLI's IIRC. You could also probably put a dli at the
very top of the screen on one of the blank lines. Note that doing too
much in an immediate VBI or DLI can interfere with serial disk i/o.

Moveing the hardware chip locations would require work. A new Pal MMU
at least. The 5200 has moved the hardware chip locations around,
except for antic. There is also the problem to getting the cart
connector going.

I've sold on eBay (even get one of the sellers newsletters, don't remember anything about PayPal being investigated. Maybe different newsletter? Maybe missed it?) and I like PayPal, BC when I use it, I know I'll get paid. Seems for some reason these days, if someone has to pay by MO for Personal check or something, they never get around to it(?!) and end up stiffing me.
At this point, knock on wood (ouch! as he pounds his head against the desk), I've never been stiffed by a PayPal or Billpoint buyer.
I'd bet a lot of the grousing about PayPal is sour grapes that PayPal was once free and now charges (which was, BTW, always stated in the signup document).

BTW, whoever started this, great troll! You have this "discussion" going on at least three other groups I've noticed so far.

My 2c, IMHO, YMMV, etc,etc.
Brad

Actually, someone in here reported that was how "Glen the 5200 man" did all the ports. Just had a 130XE with a bunch of wires running around that worked as a 5200. I don't think it involved burning a new PAL, probably just bending out a few pins of the 74LS138 on the 130XE and the !CS pins on the LSI chip in question.

Take a look at an 800xl schematic and how they did the hardware memory decoding if you get a chance. It actually doesn't take place in the PAL down to the 2k hardware area, it takes place on the 74LS138. I use this to my advantage for most of my hacks.

Even something like a hardware hack to move all the existing LSI chips to a single page would be trivial, it is just the rewrite of the OS and incompatibilty with everything erver written that would stop people.

Source record: 39003

The proms in an Atari cartridge do not have a standard eprom pinout. What I did was design my own cartridge boards and an eprom programmer (this was 20 years ago). Just for the heck of it, I even put a cartridge interface on the eprom programmer to make reading images easier (I didn't have to take the cartridges apart or do any other funny business like I did when I used the cartridge slots in the Atari).

Here are some pictures of what I did:
http://www.silcom.com/~patchell/atari/photos.html

Now of course, I didn't exactly tell you how to do it. Most unfortunate, I have lost the schematics for all of this stuff, so it can't be recreated :-(. Not even too sure if any of the stuff even works any longer....

But, if you can find the hardware/software documentation that Atari sold to potoential developers, all of the information you need to make your own cartridges is in there (this is the documentation that I used).

I know all of that, but is the hardware area of the 5200 still in that
2k regon? I don't think it is.

Howdy Lee, folks

>Was their any significant enhanchments to 4.53/4 other than
>the 'numbered' .arx autorun.sys addition? I can't think of any, but I
>haven't yet found the good source code yet either. Thanks.

Here's what I found. It's the READ.ME file that came with the 4.53/3 source
code.

CU Mathy van Nisselroy

PS is David stil around???

MyDOS version 4.53/3 changes

David R. Eichel 12/31/89

Except for the following 3 things, MyDOS 4.53/3 is functionally
identical to MyDOS 4.50. As such I won't try to recreate the entire
manual, I'll just cover the differences.

You'll probibly first notice that this version defaults to a 3
character file length/free sector count instead of MyDOS's normal 4.
This allows it to function with programs that check for the end of the
directory improperly, like TextPro, SpeedScript and the new Antic
Music Processor. Four and five character file lengths/frees will
still be displayed if needed

Secondly you'll notice that there isn't any AUTORUN.SYS file.
V.4.53/3 now allows multiple AUTORUNs at boot up. Any file with the
extender ".AR?" will be loaded and run like an AUTORUN.SYS. It will
do this for up to ten files (*.AR0 through *.AR9). The 8 character
main filename can be anything you want, only the extender will be
checked.

Lastly those of us who own Atari 800s that've been expanded with
Axlon type memory upgrades will be happy to know that v.4.53/3 now
functions properly with our computer's RAMdisk.

The only difference between v.4.50 and v.4.53/3 as far the user
is concerned is when using a custom RAMdisk format instead of a
predefined one. With v.4.53/3, instead of entering a zero as the
last number in the sequence for an XE type RAMdisk and an FF for an
AXLON type. You must now enter an FF for the XE and a 0 for Axlon
types. This is just the opposite of what it was in v.4.50 because
that last number is now an AND'd number instead of an ORA'd number.
Sorry about the confusion, but it was the easiest way to get the

Axlon as well as the XE RAMdisk to function properly. This is ONLY if you use a custom format. The predefined sequences (numbers 0, 1, 2 & 5) function (externally) just like they do in v.4.50.

A (not too) short history of this MyDOS

I've been working on this since sometime shortly after v.4.50 was released. It has gone through many stages and much testing of each. The were, in order:

V.4.50/3

-my origional hack which added the 3 character file length default.

This dates from March 1989 and was never released.

V.4.51/3

-I wasn't aware of the Axlon problem when I did 4.50/3. I just thought I was messing something up when it didn't work right. When I bothered to look at the code I found that v.4.50 was using $FF as the main RAM bank number, the correct number is 0. Fixing that wasn't a problem. But (there will always be a "but") I found it was loading the accumulator from the bank select address and treating it as something meaningful. This works with the XL/XE series but that address is write only with an Axlon upgrade so its read data is anything but meaningful. It then ORA'd that number with another to select the main bank by toggling bits on, however ("but"'s upperclass cousin) I needed to turn bits off, not on. There simply isn't anything you can ORA a number with to get 0. So after much agonizing about changing something that was specifically referred to in the origional docs, namely the critical last byte of custom RAMdisk setup, I modified the RAMdisk code to work properly by using an AND, which is why that last byte is now exactly opposite of what the docs say it should be.

The 2 column directory listing was now printed into fixed columns. V.4.50/3 just used spaces and 4 or 5 character files lengths caused the columns to wander. Absolute column positions fixed this.

The multiple autorun feature was also new to this version.

Its LoMEM was $1F06 which is 29 bytes bigger than the origional 4.50's $1EE9. This was actually a little too high. Some handlers you might want to use require a LoMEM of $1F00 or lower.

This version was released to selected members of my local users group for beta testing in August.

MyDOS v.4.52/3

-While working on an "imporved" version of Mr.Marslett's new v.4.51 I found several spots where optimizing the code would save

critical bytes of memory. I became a bit discouraged during my efforts on this improved 4.51, it seemed that every time I looked at the code it became larger, so to give myself a break I started adding the optimization changes I put in 4.51 to my version 4.51/3. As a result of this I brought its LoMEM down past $1F00 to $1EF3 which is only 10 bytes bigger than 4.50.

This version dates to the end of November and was never released.

MyDOS v.4.53/3

-The only bug I introduced to 4.50 was back in 4.51/3. It was a cosmetic one which involved what happened if you hit break during a 2 column directory listing. If the 1st column had already been printed before the break, the next list would start in the 2nd column.

V.4.53/3 fixes this.

I really wanted to bring the LoMEM down to 4.50's $1EE9 (its still $1EF3). Rather than keep playing around trying to find more RAM resident code to optimize, I decided to bend to the wishes of those who've asked me to release it as it is.

However I hold the option of releasing another version if I can find those other 10 bytes.

Notes about the source code

When I started working on v.4.50 I wasn't interested in making it a archeological dig. Code that was changed was changed and code that was removed was removed. I put a comment field at the end of every line I changed, at least an empty one, but that was about it. Since then I realized the usefulness of having what I've done flagged in some unique way. So I started retrofitting the code with an inverse space in the 1st position of the comment field of each line I've changed. I also endevored to re-add those deleted lines in commented-out form.
I have an assembly listing of the DOS code so its source is probibly pretty complete as far restoring deleted code and inverse spaces is concerned. However I don't have a list of DUP so I had to rely on a combination of memory and file comparison. Because of this there is a greater chance of the DUP source being incomplete as far as comment archeology goes.
This only concerns comments, all of the actual DOS & DUP code is there, complete and ready to assemble using MAC/65.

Changes to the new RAMboot

This new version of the file allows you to select which functions it performs when you load it.

Pressing the 1 key will cause the program to exit without doing anything. This is useful for rebooting without losing the contents of

your RAMdisk.

Pressing the 2 key will just format the defined RAMdisk type and exit. Use this to get the maximum ammount of RAMdisk space available to you.

Pressing 3 formats the Ramdisk, copies DUP.SYS to it and sets up MEM.SAV but does NOT copy the files from the RAMDISK: subdirectory into it. This is to speed up booting from a disk with a RAMDISK: subdirectory when you don't really need its files in you RAMdisk.

Pressing any other key, or none at all, makes it function just like the pervious version of RAMBOOT.

784. Atari to VGA. Found something.

> 2k regon? I don't think it is.

Yeap. I can't remember where I saw it first; if I disassembled a 5200
cart<Berzerk> and noticed all the banging on the hardware registers in the
same area or if I found some docs on the 5200, but same layout.

Just something silly like POKEY is at $D300 instead of the PIA, can't
remember what off hand.

So I think all you need to do is switch one LSI chip position and maybe
disable the PIA in the process, activate the 5200 OS. You would have to get
some way of loading files or have a 5200 cart connector wired in. I think
Bill Wilkinson said the 5200<or was it 7800?> actually had some primitive
I/O ability that would have allowed it to hook up to a drive. I never got
that far into disasembly of the OS to find it.

: Not a bad idea. You may want to talk to some of the retailers that sell
: this cable and see if they can come up with one. But really, how often do
: you use this cable? I am in the same boat as you and do not have a large
: number of serial ports, but I just unhook a device from one and the
: SIO2ST(PC) cable.

I REALLY hate unhooking cables. My PC (as with many others, I'm sure)
has a veritable rat's nest living behind it.

I have a UPS (which NEEDS a dedicated serial port!), Palm cradle
(which I like to keep hooked up, too), and digital camera (which I use a lot).

Of course, that means I have one free, but before I got DSL back, I was
stuck using a modem, so all four were being used simultaneously. :)

My biggest problem with PC's is IRQs. I tried downloading photos off of
my camera while I happened to be backing up my Palm pilot, and the photo
program crashed (which is RARE for Linux!... although it IS a Gnome tool ;))

If USB will help keep issues like this from occuring (will it?), then that'd
be reason enough. :)

> part part

I removed the RFI shielding, which didn't make any difference, and
checked around for any obvious signs of solder traces making unwanted
contact, but saw nothing glaringly obvious.

I checked the above route from the 7812 to the TIP110 as follows

(looking from the front of the drive)

7812 output --> L4 right hand solder pad 0 Ohms
L4 right hand solder pad --> L4 left hand solder pad ~60 Ohms
L4 left hand solder pad --> L6 right hand solder pad ~500 Ohms
L6 right hand solder pad --> L6 left hand solder pad 0 Ohms
L6 left hand solder pad --> TIP110 left hand leg ~60 Ohms

In the interests of measuring everything, in case I picked the wrong
path :) I also get

7812 output --> L4 left pad ~60 Ohms
L4 right pad --> either L6 pad 0 Ohms
either L6 pad --> TIP110 right hand leg ~60 Ohms

I think that covers all ways through the path above, given that both
pads of L6 appear to be shorted to ground.

I'm going to have a closer look at the pcb and see if I can't see
something obvious connecting to ground.

You'll be glad to hear that I'll have to give you a break from all this
for a while, I'm going to be working away from home for the next couple
of weeks, starting Wednesday (I'll be back for the weekend, but will
most likely be busy then too) and while I should have a net connection,
I'm not going to be carrying the 1050, multimeter and soldering iron
through an airport metal detector :)

I hope the above helps narrow this thing down a bit further...

Near infinate
> L4 right pad --> either L6 pad 0 Ohms

Should be L6 Right to L4 Right 0 Ohms
L6 Left to L4 Right > 0 Ohms.

Double check me, but I think this elimnates everything between the 7812 and
L4.

That leaves us to C42, C21 as the leading suspects. There's a bunch of other low value ones in there, but I don't believe they could have shorted w/o exploding.

Before you do any more pulling, with L4 removed, you should power up the drive again and check for 12V on the output of the 7812 and one of the L4 solder pads.
> either L6 pad --> TIP110 right hand leg ~60 Ohms

Remove and test in order
>
> I think that covers all ways through the path above, given that both
> pads of L6 appear to be shorted to ground.

No L6 is connected directly to the center leg of the TIP110. If you get 0 Ohms the left leg, your TIP110 has gone to electric lala land.

796. a question about M.U.L.E. on the Atari 800

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-30 00:00:40 UTC
From: Ken Lee <ken.lee@sitraka.com>
Message-ID: <3A760428.A8483A7A@sitraka.com>
Source record: 39019

Hello. Back in the day when I was a C64 user, and I played and loved a game called M.U.L.E. After researching it a little recently, I discovered that it was also made for the NES and the Atari 800. I've seen screenshots of the Nintendo version, and it looks quite different (in a bad way), but the Atari version looked quite nice (as far as nice can be with M.U.L.E.).

Was the game released for the Atari as a cartridge? I can't seem to find any definite answers on that. For those who saw/played it on a Commodore 64, was it much different? Based on screenshots I've seen they look almost identical, except for the colour palette. Anyway, I don't know much about the Atari home computer line, so introductory explanations are welcome.

I'm interested to know... since the Atari 800 had 4 joystick ports built in, hunting around for one would result in an easy way for four people to play M.U.L.E. simultaneously. (I know I could get an old C64, or get an emulator for my Mac, but I think four people playing the game in the living room is a lot more appealing ;)

Thanks in advance,
Ken

I did this, with both L4 & L6 removed, and got 12v on the output of the
7812 and the right pad of L4, I assume that is a good thing? :)

> > either L6 pad --> TIP110 right hand leg ~60 Ohms

Before I make a catastrophic error, remove and test what in order, C42
& C21? I don't want to rip out more than I have to, or make things
worse! :) And should I put L6 & L4 back before doing anything else?

I've seen it on disk and cassette, never cart over here in the UK, When i saw it at all!

i would like an 800 with 48k so i can have 3 friends play it with me when we have our next worms fest!

You can have up to 3 players on an XL if you have a paddle in one port, and joystick in the other. its a palava though

Absolutely! Means all those parts in between the 9VA jack and the L4 are
working. We knew a lot of them were working from snipping the output
terminal of the 7812 anyway, but this is a double positive and adds a
handful of parts into the "Test Good" side of the ledger.

> worse! :) And should I put L6 & L4 back before doing anything else?

I wouldn't, but this is where your own judgement comes into play. Remember I
am the guy who got your thumb branded.

C42 and C21 are really pedestrian parts, you could step on a transistor
radio and get 5-6 ones just like them. I really wouldn't worry about losing
them. If you are careful, you could just remove them, check the resistance
across their pins and see if it is anything other then a dead short. Really
if you had a capacitance meter instead of a DVM it would be better.

With your DVM you should see ~0 resistance when you first apply the probes
and it will steadily climb to infinite resistance.

The alternative procedure would be to jumper L4 for now and make sure it is something between L4 and L6. You could just stick a piece of wire in where L4 used to go, apply power and see if you still get 12V.

I think you can see what we are doing here. We are kind of going along the 12V circuit in inchworm fashion. Removing L4 and L6 just isolated the 12V into sections so we could check each section individually and narrow the suspect parts down.

So if you put L4 back in <or jumper it> and test for 12V, it is just making doubly sure the fault<one anyway> is between L4 and L6. Completely up to you as the results are valuble for isolating the problem.

Don't touch the diodes again if you don't get 12V on both sides of L4 though.<grin>

> much in an immediate VBI or DLI can interfere with serial disk i/o.

It also depends on the Os release. Os/A had a bug that disabled DLIs
within the SIO routine. There's not much you can do about it, except maybe
to re-enable it within a custom SER-IN interrupt. This bug was AFAIK fixed
in Os/B, and it definitely *is* fixed in the XL-Os. Except that, I would also
recomend to follow the hint above, i.e. re-load the hardware register from
the corresponding shadow register in a *small* immediate VBI routine.

A "STA VSYNC" might not always help since the Os uses the same register for
a controlled delay here and there, causing your VBI to jump down by one line.

You might want to try whether you can get away without a STA VSYNC at all.
Since ANTIC eats a lot of CPU time in Gr.8/ANTIC F, you might place loading
the Akku early in the DLI, and store it in the hardware register right at the
end of it such that the electron beam is no longer visible. You may get away
with several NOPs and careful timing.

DLI:
PHA
LDA #$34 ;suppose you want to store "red" in background
NOP
NOP
NOP
STA $D01A ;COLBK
PLA
RTI

So long,
Thomas

Hello,

[usb to a8]

I think, it will be (almost) impossible for some reasons:

- IMHO USB is a real shared bus with a defined protocol, not just a serial line, where you can do, what you want

- the Atari8 uses some additional lines , which are only simulated with an abuse of some signal lines of the serial port

So the interface must provide "some intelligence" - I don't know, if one could handle that without the use of special usb-protocol chips. And if I remember correctly, they were not commonly available.

Bye,
Matt

>
The Atari's control of the display was miles ahead of it's time so
special effects like lots of different screen resolutions on the
screen were very easy to do via Display List Interrupts (DLI's).

Sadly the Atari was not as well endowed in the sprite department (it
is older than the C64) hence Green Beret was almost cancelled for the
Atari due to (strangely) the trousers etc on the main character.

It was released in the end but that's where you can see a difference
between machines.

>room is a lot more appealing ;)

Yes, its a nice multi player game..

And thankfully you didn't as a C64 owner decide that the game was
released on the C64 then ported to the Atari, lots of C64 owners
(myself excluded) seem to think all the old games were released for
their machine and everyone else copied them :-)

Whilst a lot of old stuff came from the Apple a fair bit was written
for the Atari then ported on :-)
--

Give me a good playable old game rather than a pretty new one

as for me, I used some years ago the "Compy Shop Text Editor". AFAIK
it was a freeware tool.

This prog was a *Real* Editor. You could start it within of any OS by
simply typing "EDIT" he, he ... ok, it's only in 40col screen but had
some easy menu structures and key-macro's built in...

well ask me, if you wan't a copy.I have to search it if you really
want have a look on the editor.

Paypal has done millions of transactions and I've never heard of someone losing money. As far as giving out a credit card number to a reputable company on the net, its far safer than lot of transactions that people do in person or over the phone. Think about it when you hand over the plastic to someone at a restaurant or bar. A lot of numbers get stolen that way.

> I am sure that Paypal is taking a significant chunk of your profit
> there too.

Fee schedule: ($5 is maximum fee)
< 15 30 cents
> $15 30 cents + 1.6% for balance or checking
> $15 30 cents + 2.2% for credit cards

Adds up to about $1 for a $50 item or $2 for a $100 item. I would gladly pay the seller's fee than trudge down to the PO for these amounts. Or, why not split the fee with the buyer? The seller gets his money immediately and is able to ship right away, so Paypal is to his advantage also.

Source record: 39041

I've been trying to figure out exactly what the Atari 8-bit line's limitations were when it came to graphics. Seems that after the Atari 5200 fizzled not many 8-bit games really pushed the envelope and then the ST came out and 8-bit development kinda stopped. The Lucas Arts games (Edilon, REscue on Frac. etc) were impressive examples of what the 8-bit line could do. Any others?

Just wondering what people's opinions were on this one.

I remember playing a very cool baseball game on my Atari 800. The 3D perspective of the field was from the first base side. So when looking at the field, home plate was to the left, first base on the bottom, second base on the right, and third base at the top.

What game is this?

Thanks,
Chad

You need to check out some of the incredible graphics in the games
and (more typically) demos that came out of Europe in the late 80's
through mid 90's (and probably trickling out still today)

Definitely the LucasArts games... Since most games were ported from the C64,
they ended up looking pretty sad next to the C64 counterparts and were meant
for the C64's strengths (better music, more usable colors). Ballblazer was a
stunner and my Commodore friends were jealous at how bad the C64 version was.

Hmmm. Are you sure about this ? I think Behind Jaggi Lines (later Rescue on Fractalus) was released and developed on Atari's. I got the impression you were joking as I had exactly the opposite experience. The C64 version ran slower, with less colour and less dynamic music (specially in Ballblazer, Ballblaster)

let's check the games, lucasfilm released on 8-bit atari:

*rescue on fractalus (definitively first on 8-bit atari, an experiment
of a startrek-movie animation guys)
*koronis rift (I think it's virtual fractalus II with some enhancments
in graphics and speed)
*eidolon (well, the last fractal-based product...hmm hard to say which
platform was the first)
*ballblazer (at all much better than the c64 version, and for sure
first on atari)

hmm no more games from lucasfilm on atari side?

IIRC, the spin-off of an atari/lucasfilms coorperation.

Good question. Did "Labyrinth" ever appear on the Atari? There's a commercial
for this game in a Koronis Rift level. (-; There is a C64 version at least,
it's some kind of a "LucasArts" adventure, maybe the first one. I'd guess it's
earlier than "Maniac Manison", but I don't know either.

So long,
Thomas

I did read the book "Das Lucasfilm Games Buch" (what innovative name
g). It says something about "The Labyrinth" and is in fact, the
first SCUMM based adventure made by Lucasfilm.

This book describe the rise and fall of lucasfilm/atari games. And the
very last product was "The Eidolon". After this, lucasfilm never
developed any other atari games....

Wasn't there any Epyx<->Lucasfilm relation, too? I know that Aric
Wilmunder worked for Epyx prior to Lucas and I believe that Epyx either
ported the Atari versions to the C64 or vice versa.

Greetings,
Manuel

It may not have cornered the graphics market, but I'd vote for Alternate Reality. The graphics weren't BAD by any means, and in terms of depth and playability I don't think they have any equal.

832. FA: New/Sealed Atari 400/800/XL/XE Games

Newsgroup: comp.sys.atari.8bit
Date: 2001-01-31 15:40:48 UTC
From: Richard Smith <rsmith@NOSPAMplaneteer.com>
Message-ID: <vKXd6.8465$Oe.38243@tor-nn1.netcom.ca>
Source record: 38955
Cross-posted to: comp.sys.atari.8bit,rec.games.video.classic,rec.games.video.marketplace,rec.games.video.misc

I have the following games up for auction on Ebay:

Atari 400/800/XL Atlantis (new/sealed)
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1210635288

Atari 400/800 Crossfire Cartridge (new/sealed)
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1210635943

Atari 400/800/XL/XE Final Legacy (new/sealed)
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1210636519

Atari XL/XE Food Fight Cartridge (new/sealed)
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1210637204

Thanks for looking.

Richard.

Sounds like Star League Baseball. Can you remember
trivias between innings?

thomsen <twh1@gmx.de> wrote:

: *rescue on fractalus (definitively first on 8-bit atari, an experiment
: of a startrek-movie animation guys)

Loren Carpenter... See "1980" on this page:

http://www.visualfx.com/milestones.htm

They mention creation of Rescue of Fractulus as a 'milestone'! :)

A little more info on Loren (brief web search):

Applications of Fractals - Special Effects
http://library.thinkquest.org/26242/full/ap/ap18.html

UW CSE Alumnus and Pixar Co-Founder Loren Carpenter
http://www.cs.washington.edu/homes/lazowska/impact/carpenter.html

The Genesis scene in Star Trek II: Wrath of Khan was conceptualized
and directed by Alvy Ray Smith (currently/recently at Microsoft).

Loren worked with, amother other people, Tom Duff, who I saw speak
at a Comp. Sci. colloqueum at Sonoma State University while I was there.
Loren did the fractal terrain, Tom did the moon.

One problem that Tom said occured during the rendering and filming of the
Genesis sequence was that, since it was random, at one point, the camera
flew THROUGH one of the fractal mountains. They had to re-render that
portion with a piece of code that would 'squish' the mountain out of
the way. It took almost as long to re-render that part as it did the
entire sequence. :)

Another problem they all had was that the Genesis scene was choreographed
from beginning to end, and was created as one long, beautiful sequence.
Then the editor of the movie decided to break it up (unnecessarily!)
by throwing a picture of the Enterprise crew looking impressed. :)

We need more (modern) games like Rescue on Fractulus. Doom/Quake
style games with man-made structures, and Heavy Gear style games with
lever-designer-designed landscapes aren't as interesting.

Hrmm... 3D fractal lunar lander? :)

837. PhillyClassic 2001 UPDATE: 01.31.2001

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-01 02:36:20 UTC
From: Chuck Whitby <intv-sama@worldnet.att.net>
Message-ID: <3A4FEBCC.85F6BA6@worldnet.att.net>
Source record: 38961
Cross-posted to: rec.games.video.sega,rec.games.vectrex,comp.sys.cbm,comp.sys.atari.8bit

** PhillyClassic 2001, The East Coast Classic Gamer's Event! **
** http://www.phillyclassic.com **

** UPDATE: 01.31.2001 **

Table spaces are becoming EXTREMELY limited so if you're planning on attending and are debating getting a table, MAKE YOUR DECISION SOON! :)

Randy Femrite is going to bring down all sorts of neat Jaguar items to show off like a Jaguar Rotary Controller, Battlesphere, Skyhammer, and a XE/Jag controller interface!

** UPDATE: 01.22.2001 **

Hasbro has sent us a lot of games to be given away at the convention! Thanks Hasbro!

Michael Roberts has donated a TON of Star Wars handheld games for us to give away at PhillyClassic. Thanks Michael!!

** UPDATE: 01.10.2001 **

Digital Press has graciously donated MANY Digital Press 6 guides to be given away at PhillyClassic! Thanks Joe and everyone else at DIGITAL PRESS!

We rented another 1000sq ft room for the convention, bringing the total up to 3000 square feet!!

More and more sponsors are contacting us EVERY DAY meaning more chances for everyone to leave PhillyClassic 2001 with a GREAT prize!

Classic Gaming Expo and PhillyClassic have teamed up to bring you the best gaming experience you can get on the east coast!

John Hardie and Sean Kelly are graciously donating items for us to give away at the convention. When you hear the names Hardie and Kelly, you know they've gotta be good!

Ticket prices are currently $6 in advance, and $7.50 at the door. Tables to setup your goodies on are $10 per table. Tickets will be on preorder until March 30th, 2001. Just remember, we're a non-profit event, every cent we make on PhillyClassic goes right back into the convention!

This year's tickets are pretty nifty! Marc has made Intellivision carts into our tickets that hang from you neck! Really neat!

** UPDATE: 12.23.2000 **

Sponsors are pouring in, which means more chances for everyone to walk away from the convention with a great FREE item!!

T-shirts will soon be available for pre-order. These spiffy shirts feature the PhillyClassic logo and some classic game logos! Be sure to put an order in as soon as they're available!

Randy Crihfield of Hozer Video Games has donated some new Atari 2600 games to be given away! Thanks Randy!

Jeff Folejewski will be bringing MANY (as in more than 5) full-size coin-op arcade games! All games will be set on free-play and a tournament will be held on his Joust machine!

Good Deal Games has also chosen to donate some of their new Sega CD games to be given away at PhillyClassic! Thanks Good Deal Games!!

** UPDATE: 10.30.2000 **

Van Burnham, editor of Wired magazine and author of Supercade (www.supercade.com) has confirmed she will be attending PhillyClassic! She's a great video game buff and a wonderful person to talk to!

Be sure to bring all your spare games and systems, we will be holding another auction this year! Last year people who auctioned items off made a LOT of money, and it's a good way to part out some of the extra items you don't need!

** UPDATE: 10.15.2000 **

Chad Schell of Schell's Electronics has donated an Intellicart to be given away as a prize at PhillyClassic!! Thanks Chad!

Tickets for PhillyClassic are now on sale!! The price for admission is $6 for both days, and $10 per table you wish to use to setup on. Just remember, any money taken in from the attendees is not used as profit for any of the organizers; it's used to pay for everything used to setup the event. In case of any spill over money it will be used towards next years event!!

If you have any items in particular you're wanting to pick up or to part with, be sure to e-mail Jeff Folejewski and let him know so he can add your list to our PhillyClassic webpage!

** INITIAL POST: 9.26.2000 **

David Newman, Chuck Whitby, Marc Pallante, and Jeff Folejewski are proud to present PhillyClassic 2001!! The first PhillyClassic was such a success we had no choice but to do it again!

This year's event promises to be nothing but BIGGER and BETTER!

Website is now up and LIVE, complete with:
* Information/scheduled events
* Hotel accomodation info/online reservations
* Driving directions and interactive maps
* Ticket information
* How To Link to Us banners/ads available for
YOUR classic game related site!

The weekend of April 20th and 21st will be one to remember as classic
gamers unite for a weekend of hardcore gaming!

Planned events include casual trading/selling, *tournaments*,
auction, show-and-tell, a guest speaker or two, and a
general good time by all!

We have rented a 2000! sq ft conference room at the Sheraton
Suites for the event, which means enough room for a lot of
people to come and setup the pride and joy of their collections,
and even a little tradebait!

The tentative times are as follows:

Friday: 5pm - ?? -- First Day, Setup, Meet and Greet, Informal
Trading and Game Playing
Saturday: 9am - 5:00pm -- MAIN DAY

If you have any questions about the event, PLEASE e-mail:
David Newman (davidnewman@adelphia.net)
Chuck Whitby (intv-sama@worldnet.att.net)
Jeff Folejewski (adventurevision@yahoo.com)
Marc Pallante (marc@classicgamer.net)

If you plan on attending, please
purchase your tickets early and make those hotel reservations!

Thank you very much!

Yes! That's it! Thank you...

I remember really liking that game... I'll have to load it up on my 130XE
and give it another go!

>(I know I could get an old C64, or get an emulator for my
>Mac, but I think four people playing the game in the living
>room is a lot more appealing ;)

There are some differences between the C64 and Atari 8-bit versions...

1) Atari version was indeed able to play up to 4 players
simultaneously using joysticks. The C64 must relegate two of the
players in a four player tournament to use the keyboard.

2) Graphics were enhanced some on the 8-bit Atari version. Most
notably in the display-list interrupts that allowed shading in the
title screen and in the ships.

3) The 8-bit Atari version was written first by Dani (nee Dan) Bunten
(R.I.P.), brother Bill, Alan Watson and Jim Rushing, and was released
as a disk-based game by Ozark Softscape, distributed by Electronic
Arts in 1983. It was ported to the C64 the same year by Ozark/EA, the
IBM PC Jr. in 1985 by IBM, and the NES in 1990 by Mindscape.
Unofficial versions also exist for the MSX-1 and PC-8801 Mk. II.

Ironically, your planet's name is "Irata" (Atari spelled backwards) in
all official versions.

Yep. Hasbro wanted to ditch Atari after reporting large losses... so they found an interested buyer in Infogrames, who agreed to snap them up at a price tag that'll leave Hasbro with $71 million more than they paid for Atari in the first place.

I think you misread my post... LucasArts games were far superior on the Atari 8-bits over the C64 machines. However, most other games tended to look and sound better than the 8-bit machines.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

All,

Does anyone know what exactly needs to be done to work a 5200 cart rom image to load on a 8-bit?

The Atari-History site has a bunch of 5200 roms I'd love to get running on my 800. And cgexpo.com has the rom image of the 5200 Tempest.

I found the A.N.A.L.O.G. articles about going from 8-bit code to 5200... But has anyone seen any way to take the raw 5200 rom image and work it into a loaded 8-bit file?

-Bill

Howdy Atarians!

After collecting thousands of 8-bit Atari software I have the problem
in organizing all those types of binary data.

What's your concept (i.e. filestructure) to get all those various
file-types to reconcile?

virtual HDs, .DCM, .ATR, .EXE, .COM, .BIN, Module files, MegaImages.
Real Disks...
various emulators, ape and so on..

?

Great game at that time. I remember myself spending
many weeks with it (instead of practicing the real
game).

Hey guys.
I have a complete working Atari 800XL system for sale. It comes with:
-800xl unit
-two disk drives (one with Happy (tm) modification)
-3 disk banks full of games
-Star 10x printer
-Multiple cartridge games
-two joysticks
-roller ball controller (does not work, may need new cord)
-a large box full o' books and documentation for the 800xl system and a couple of the games.

Please email with an offer or if you would like additional info or a pic.
-greg

856. Seattle Atari 2600 Championship

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-01 23:48:36 UTC
From: tenthings@my-deja.com
Message-ID: <95cskhljv1@nnrp1.deja.com>
Source record: 38980

```
Atari 2600 Championship
Sunday February 25th, 2001
Registration and practice 1pm
Contest begins at 2pm
NW Classic Games Enthusiasts Annual Meeting and Exposition
Saturday February 24th, 2001 10am-5pm
```

The Atari 2600 was the video game system with the fake wood grain accents that revolutionized the home video game market. It was the precursor to the Nintendo, Sega, and Playstation systems that are popular today. While the Atari 2600 is nothing short of a dinosaur compared to modern video games, it's archaic 8 bit technology continues to endear itself to those who grew up playing crude versions of Asteroids, Pac-Man, Space Invaders, Centipede and others on their 2600 systems.

The 5th annual Atari 2600 Championship has become one of the most anticipated local events for anyone interested in 70's and 80's nostalgia. What began as a small event back in 1996 has grown with each year. The last competition attracted more than 30 contestants from around the Pacific Northwest and dozens more came to watch and cheer on the participants during the head-to-head competition.

The contest is open to any and all who want to test their old school video game skills but only 12 uber-geeks will make it to the semi-finals. From there, the competition really heats up as, round by round, more contestants are eliminated until there are only two left—one of those will become the 2001 Atari 2600 Champion

```
There will be 6 games chosen for the contest, the names of which will
not be revealed until the day of the championship. The super-secret
mystery game will determine the winner but the identity of that game
will remain unknown until the moment of truth!
```

The entrance fee is $5 ($8 with a special edition commemorative t-shirt). Prizes will be given to the 12 semi-finalists—with additional prizes for the top three finishers.

The 5th Annual Atari Championship will be held at Hi*Score Arcade (612 E. Pine St), Capitol Hill's only arcade, featuring video games and pinball machines from the 70's-present.

```
In association with the 5th Annual Atari Championship, The Northwest
Classic Games Enthusiasts will be holding their annual meeting and
exposition on February 24th. This is a chance for classic games
enthusiasts to buy, sell, and trade games and to show off their rare
```

classic games and consoles collections. The meeting takes place at: 308 Fourth Avenue South, Kirkland, WA, from 10am-5pm, February 24th.

I have to agree with Bill, the European's have pushed the envelope when it came to graphics on the 8bit!

Zybex is one of my favorite examples. Alternate Reality is one of my favorites on

the US side. And the APAC brought even more detailed color pictures to the 8bit.

Jindrich,

You have a good start on the schematics. Here are some additions I can recommend
to make it a complete and well detailed schematic:

- Add the values of the resistor (value in ohms) and capacitors (in Farads)
- If you need help, email me the colors on the resitor and the numbers on the caps

- IC part numbers for the chips (74LSXX?; 74HCXX?) - maybe use a table on the schematic with part reference (U1, U2, etc) and the part number next to it.

- I would replace PHI2 with B02 (with a slash through the zero). I know that this is what was used in Mapping the Atari, but B02 is the label Atari used. Stands for Buffered Phase 2.

- Add pin #'s to the chips and what pins they connect to on the ROM.

- Replace the IO1 with chip references like U1, U2, U3, etc.

Hope this helps. I don't want to sound critical of your schematic, it's just nice to have a schematic that gives a detailed picture of the circuit and its make up of parts.

I will be there with the Vectrex display items again. Maybe my D size drawings will make it on the walls this year.

Anyone going from the SF bay area? Maybe we can share a ride. If I drive I may take the display stand as well for all to see.

I've got to sell something to pay for more music gear!

So: Atari 65XE, 800XL 256K, 800XL with not functioning stereo upgrade
(it works, just the stereo doesn't seem to behave) and 2nd PIA, one
1050, some software, XEP-80.

Need about ï¿½50 (it's for a Roland MPU-401 interface and wavetable card),
it's in Scotland.

(And I'm keeping an 800XL, 1050 and 1010 so I'm not out of the 8-bit
entirely :))

Atari 8-Bit Computers

Vendors and Developers List

"A comprehensive list of vendors, developers, publishers,
and repair shops for Atari 8-bit computers and their users"

Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current
mailto:mcurrent@carleton.edu

Please refer to the latest version of this FAQ list whenever possible!

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

news:comp.sys.atari.8bit news:comp.answers news:news.answers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

It's really, after all, the classics that endure. Ms. Pac-Man, Galaga,
and even Vs. Super Mario Bros. will tromp all over Police Trainer, MK4,
and all that other BS.

Hello,
I'm getting ready to get rid of my ST because I need the desk space. But, before I'm do, I was hoping I could find Bubble Bobble for my 800XL. Or maybe even Rainbow Islands. I've checked on a few web sites but haven't found them. Anybody know if these games were ever ported to the 8-bit?

Star League Baseball is still my favorite all-time sports game. I
remember playing that game for hours everyday. I bought it BEFORE
I even owned an atari computer. It was that game that made me buy an
atari 800XL just to play it. Back then the 800XL needed a 'translator'
disk to play it. Star League Football was pretty good too. I wonder
why the creator of those games (GameStar) moved on to
other things after their release?

>>> Sounds like Star League Baseball.
>>
>> Yes! That's it! Thank you...
>>

Glenn Bruner <brunergs@pcisys.net> wrote:
: Zybex is one of my favorite examples.

Zybex is alright... it doesn't push the envelope, though... it's just
160x96 four-color mode with some sprites... Nicely drawn graphics, though!

: And the APAC brought even more detailed color pictures to the 8bit.

Then came ColorView mode (80x192 4096-colors and 160x192 64-colors),
and HIP mode (160x192 32-greyshade or something)... both of which are
interlaced, like APAC mode often is.

(For some reason, the european demos I've seen that use APAC don't
interlace it! Anyone know why???)

The graphics I'm talking about in demos, though, are stuff like this:

Hi,

Do you also have the schematic for SDX, Diamond GOS and or EXPRESS! ???

Secondly, may be you can post de-soldered pcb pictures this way it's easy to create schematics of the cartridges...

Need help urgently!!!

Having just used both a800win 2.7 & 2.7b, I am having a prob with the roms, If I boot without an image (disk) and basic is disabled, and i select memory test from the self test screen, everything is ok, but if i then install or load in a disk image, and later cold or warm boot the emulator it will jump to self test, and if you run the mem test the rom shows up as red (bad rom), I got the roms (xl,osb,5200 etc) from the links in david firths site (programmer of a800win), is there any reason for this or am i doing something or, or is there a bug in a800win that prevents the roms workinmg properly, I am also having a problem in using the omnimon rom image and qmeg rom images in a800win 2.7b
Does anyone know where i can get a rom image of the osa version of a800 o/s

yours atarily

Hello Atarifreaks, hows the atari going, keep the faith and keep the atari hummy

Anyway is there anyone out there in atari-cyberspace that is interested in cheating on the atari games thru emulators (like a800win, handy etc etc...) then read on

Recently I downloaded a couple of utilities from the internet, they are called game trainers, similar to pro action replay on the megadrive/snes etc

the best one i've used at the moment is game wiz 32 which allows you to find addresses for lives, energy etc etc, not just on pc games but also the games running thru emulators

Their is only one problem with this programme, if you are using it thru 8bit emulators thru win 9x, it disables the save feature for some reason, however it doesnt stop you manually writing down the addresses for the games and then, when your not using the emulator go load up game wiz, even though you havent got any addresses, press or select the add button, type in the addresses and the label (what the cheat does) and continue the process untill you have entered all the cheats for that game (do not insert the variable/value) select save, delete the prog manager entry, type in name of emulator followed by hyphen and the name of program, it will save, now all you do is reload the emulator and the game you found cheats for, pause the emulator or get back into windows, go to game wiz, select program select, select of the emulator you have chosen, and press ok, go to the load icon and select the file of the game you wish to cheat on, if you have selected freeze value, unfreeze it, go back to the emulator play the game for 2 secs. pause it and the emu go back to game wiz and select the entries , youll now notice that values have now been assigned freeze the values or enter new ones and freeze new values and go back to your game and you will now have the cheats installed, beware though that when you reinitialize the game it might store the location for lives energy etc in a different location, this is true of some lynx games i've being playing... I am currently looking at a few other game trainers

Getting back to you soon

Happy Atari'ng

876. Alternate Reality Question -- Rainbow for the Mac?

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-03 20:47:35 UTC
From: James <jamesnospam@rcn2.net>
Message-ID: <3A7C6E60.239F@rcn2.net>
Source record: 38900

I am interested in people's experiences playing Alternate Reality using Chris Lam's Rainbow emulator for the Macintosh platform. Since Chris requires his software to be registered before one can save or modify disk images, I can't thoroughly test either The City or The Dungeon without registering. Of course, I'd like to know how well the game plays before I register. ;)

If you've successfully played AR under Rainbow for the Mac, please fire off a reply here describing your experiences. I know some other emulators have a very hard time with entering and leaving the various shops, banks, inns, taverns, etc. in the game... do problems like this show up under the Mac version of Rainbow?

Any help would be appreciated...

J.

I don't have any supercartridge. Nir sent me those PCBs and I made
schematics from them.

But, making schematics for SDX is of no sense, because there is code in
PAL, which is unknown. I made some changes to my page about SDX
bank-switching logic. I will post them on monday.

Bye,

I would have to join in with the Alternate Reality crowd. The
capabilities of the 8bit were tweaked in so many ways to display that
world.

Cavernia is a later game with great graphics, some of them a little
too distracting. Tube Baddies has great graphics.

Sound like loss of hsync. Does the tv have an adjustment? May need a tweak.
or
Usual things:make sure the channel switch is right.
May need to tweak the rf modulator.
May need to reseat the boards/chips.
Make sure cart sockets are clean.
Antic, CTIA(GTIA), CD4058 thru to RF modulator are involved in color and hsync.

Not really, its certainly prettier but as with all the Hasbro things I
have seen it lacks the 'just one more go'.

Back in time did a review on it a while back.

you're right! The game handling is pretty difficult with the keyboard control and somewhat dumb ... setting the control to select and option key! My theory is, that this was the only way to give the atari the same keyboard control as the c64 version, because the keyboard handling of 8-bit atari didn't support more than one key at the same time...

Since getting a laser printer a year or so ago, I continue to have problems printing inverse and other special characters -- usually in BASIC listings. I now print through APE 95/98 100%, and it does allow stripping the high bit and provides EOL -> CR/LF conversions, but that only solves part of the problems. I wrote a Q&D BASIC program to handle all of the nasties, but that still requires LISTing the program to be printed then running my printer program to print the actual listing on my laser. Not the most cumbersome situation, but certainly not as transparent as I'd like. Anyone aware of any better solution (not involing buying another printer).

Hi Larry;
I don't think this has been solved; I have not found a G colon type handler for anything except the old 9 pins. I have to List the file and either use an A8 Basic program to rotate and expand the dots for the 24 pin or try a PC app with the A8 true type fonts which do not have the inverse & control chars in the correct location.

-Ron

Inform everyone that communications have completely broken down.

896. FS: Atari Computer related literature

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-05 02:47:58 UTC
From: otakuvidiot@hotSPAMMYmail.com
Message-ID: <903ED3FC0otakuvidiothotSPAMMY@64.154.60.100>

Retrotaku / Zer0-Byte Bookstore offers the following antique computer and videogame books for purchase.

If you are interested in any of the titles, please send an e-mail to retrotaku@otakuboy.com to inquire about availability, or if you have any questions.

Thank you for perusing the list.

[000005] Scanlon, Leo J.. 6502 SOFTWARE DESIGN. Indianapolis, In, Usa: Howard W. Sams, 1980. First Edition. 8vo - over 7" - 9" tall. Soft Cover. Fair / No Jacket. A very good introduction to the 6502 microprocessor, a popular 8-bit chip in the early 1980s, used in _many_ computer systems including a number of Apple systems, the Commodore 64 and the Nintendo Entertainment System. Great information on pinouts, how to address the chip, register controls, and much more. Listed as a 6502.org MUST-READ. ON CONDITION: Shelf-worn and creased on many pages. A number of pages were held together via paper-clips. (Grrr..) Many of the passages are highlighted and there are some pencil notes here and there.
$8.00

[000026] Glossbrenner, Alfred. THE COMPLETE HANDBOOK OF PERSONAL COMPUTER COMMUNICATIONS. New York, New York, USA: St. Martin's Press, 1983. First Trade. 8vo - over 7" - 9" tall. Hard Cover. Very Good / Good. Special Edition, printed for industry. This book explains how to get online and get into the wonderful world of BBSs, circa 1983. If you remember the computers from the time -- XT, Commodore 64, Apple // series, CoCo, etc. Goes into remarkable detail on the services of the time, the various communications protocols in-use and upcoming. ON CONDITION: Spine upper and lower edges are bent from shelf placement. Dust jacket creased along edges. Also, a "Compliments of Hayes" sticker is affixed on front, but this may not be a defect, depending on your opinion. First page is stamped with a "from the library of" stamp. Visit http://otakuboy.com
$9.00

[000028] Williamson, Mickey. ARTIFICIAL INTELLIGENCE FOR MICROCOMPUTERS. New York, New York, USA: Brady Communications Company, Inc., 1986. First Edition. 8vo - over 7" - 9" tall. Half-Leather. Text Book. Very Good / No Jacket. Ready to turn your business into an AI heaven? Want to walk into the office and hear, "Hello, Commander. Computer reporting". This book will explain the 1986-state of AI and where it's going. The focus, as I said, is how you can use it in your business. ON CONDITION: One dent on upper spine and slight wearing on spine where it connects to front cover. Very clean. Visit http://otakuboy.com
$7.00

[000003] Sippl, Charles J. , Roger J.. Computer Dictionary & Handbook. Indianapolis, In, Usa: Howard W. Sams, 1980. 3rd Edition. 8vo - over 7" - 9" tall. Hard Cover. Very Good / No Jacket. Large dictionary of computer terms. Contains a vast introduction to computers and various languages of the time. Of large interest to someone who wants definitions of computer terms from the era -- programmers of classic systems, early languages, obsolete CPUs, etc. Contains a few predictions on the future of computers. ON CONDITION: Back cover has very light, vertical scuffle mark along height. Upper right corner of back cover has small marks where adhesive glue affixed original price tag. Upper left corner of back cover is pressed. To the left of the title page is a small punch mark into the binding, which is not visible elsewhere. Otherwise, general shelf-wear. Visit http://otakuboy.com
$11.50

[000029] McClellan, Stephen T.. THE COMING COMPUTER INDUSTRY SHAKEOUT. New York, New York, USA: John Wiley & Sons, 1984. First Edition. 8vo - over 7" - 9" tall. Hard Cover. Very Good / Fair. A really neat tour of the computer industry in the early 80s. All the old favorites and players are here, from AT&T and IBM and DEC to Commodore, Atari, Tandy, Apple (right on the cusp of the Macintosh birth, no less!!!) . Mr. McClellen is warning you, though. "THE COMPUTER INDUSTRY IS GONNA FREAK!" Turns out, he was partly right. ON CONDITION: The dust jacket has bent and slightly creased along its edges. The front of the jacket is foil-stamped, and some of the foil has flecked off in tiny areas and tarnished on one part of the back jacket. Also, bottom left of back jacket has its coating torn, harming some of the text underneath. Book itself has slight shelf-wear on bottom of spine. Visit http://otakuboy.com
$8.00

[000030] Martin, James. DESIGN AND STRATEGY FOR DISTRIBUTED DATA PROCESSING. Englewood Cliffs, New Jersey, Usa: Prentice Hall, 1981. First Edition (?). 8vo - over 7" - 9" tall. Hard Cover. Text Book. Good / Fair. Is James Martin a MAGICIAN? ! You might think so, especially if you check out the picture of him on the back in Conjure-pose. Here he is in a book (one of many) where he extolls of the virtues (in excrutiating detail) of distributed computing. And, yes, this is way before SETI, way before multi-processing PCs running Windows 2000. So, this guy just might be a magician or at least some kind of prophet. ON CONDITION: Dust jacket is creased and torn around edges. It is intact. Books seems to have been stored at an angle. As such, the whole of the book is twisted a bit on the spine. No pages are torn, but the spine has no doubt weakened. Visit http://otakuboy.com
$8.00

[000031] Schreiber, Linda M.. ADVANCED PROGRAMMING TECHNIQUES FOR YOUR ATARI. Blue Ridge Summit, Pennsylvania, USA: Tab Books, 1983. First Edition. 8vo - over 7" - 9" tall. Soft Cover. Very Good / No Jacket. A very nuts-and-bolts Atari programming book geared toward Atari's first foray into the world of home PCs -- the Atari 400 and 800s. Covers graphics (ANTIC, specifically) , animation, voice programs, BASIC, disk drive usage,

among other things. Includes some nifty programs. And remember: All this can be typed write into one of those Atari 8-bit emulators about the Net. Has a nifty pic of an Atari 800 on the front cover. ON CONDITION: Edge-wear and shelf-worn. Mainly light creasing along spine edges. Otherwise, very clean. Visit http://otakuboy.com
$15.00

[000032] Allan, Boris. POCKET GUIDE: LOGO. Bath, England, United Kingdom: Pitman Publishing, 1984. First Edition. 32mo - over 4" - 5" tall. Spiral. Very Good / No Jacket. A pocket reference guide for that grand, old, "easy" language LOGO. You remember; the one with the turtles that drew lines across your screen. Old programmers know that LOGO is a powerful language with a deceptively simple syntax. This booklet references the entire language. Get the book, download a development environment like WinLogo, and go to town. ON CONDITION: Portion of the original price tag is on front. A minor bubble on the back panel and some light pencil marks on back panel. Visit http://otakuboy.com
$11.00

[000033] Stine, Megan and H. William. MICRO ADVENTURE NO. 2 JUNGLE QUEST. New York, New York, USA: Scholastic, 1984. First Edition. 12mo - over 6" - 7" tall. Mass Market Paperback. Good / No Jacket. Scarce - 1984 -- Computers were "the future" and kids could have it all for them if they'd just learn how to program. This books brings kids through an adventure in which small BASIC programs kids would enter into computers from the era woud help save the world! ON CONDITION: Slight creases down edge of spine and front cover. Another crease near the spine on the front cover. Both creases crawl along the length of the book. Small dent in the upper back cover. Otherwise, general shelf-wear. Visit http://otakuboy.com
$11.00

[000038] Conway, Gerry. ATARI FORCE #11 "By Blackjak Betrayed!". ill. Lopez, Jose Luis Garcia. New York, New York, USA: DC Comics, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Very Good / No Jacket. Long live ATARI FORCE! During the first set of videogame heydeys, Atari and DC Comics teamed up to bring a set of stories to the comics pages. Mini-Atari Force issues were distributed with some games. In the comics shops, full-size issues were available with a continuing storyline. In this issue, Blackjak betrays the Force ... But WHY? ON CONDITION: Very small creases near edges of stapes. Otherwise, pretty clean. Color is good. Visit http://otakuboy.com
$8.00

[000039] Conway, Gerry. ATARI FORCE #2 - "Dart Vs. the Warbeast". ill. Lopez, Jose Luis Garcia. New York, New York, USA: DC Comics, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Very Good / No Jacket. Long live ATARI FORCE! During the first set of videogame heydeys, Atari and DC Comics teamed up to bring a set of stories to the comics pages. Mini-Atari Force issues were distributed with some games. In the comics shops, full-size issues were available with a continuing storyline. In this issue, we meet some of the team's mortal enemies. Also has a profile of

"Champion". BONUS: Ad for TREASURES OF TARMIN for the Intellivision. ON CONDITION: Some light creases around covers, mostly around edges of staples.Visit http://otakuboy.com
$8.00

[000040] Conway, Gerry. ATARI FORCE #3 - "Pakrat Goes WILD!". ill. Lopez, Jose Luis Garcia. New York, New York, USA: DC Comics, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Very Good / No Jacket. Long live ATARI FORCE! During the first set of videogame heydeys, Atari and DC Comics teamed up to bring a set of stories to the comics pages. Mini-Atari Force issues were distributed with some games. In the comics shops, full-size issues were available with a continuing storyline. In this issue, we meet some of the team's mortal enemies. Also has profiles of "Dart", "Babe", "Morphea". BONUS: Full of ads for classic videogames: Frogger, Q*Bert, Pole Position, Popeye, War Room and Masters of The Universe. ON CONDITION: Some light creases around covers, mostly around edges of staples. Visit http://otakuboy.com
$8.00

[000048] Various. ANALOG COMPUTING - DECEMBER 1984. Cherry Valley, Massachusetts, USA: Analog 400/800 Corporation, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. 1984 was high-life for Atari Computers. Think about it. The XL series were riding strong and all those nifty new XE systems were just about ready to debut with their 6502c and FREDDY chips. You Atari fans know what I'm talking about. ANALOG was the BIBLE of that Atari fandom. And this issue is no exception. This one's a Christmas issue, with all kinds of ideas of what to stuff in stockings. Big article on Atari-style FORTH in here, too, along with a weather utility program and a game. BONUS piece is the big center spread ad for the OKIMATE 10, the first really low-cost color printer for home computers. Can you say, "Thermal Transfer"? I knew you could. ON CONDITION: The cover is a bit loose from the staples; you can't so much see it as you can feel it. There is an overall warp to the magazine and some creases along the spine. Visit http://otakuboy.com
$8.00

[000049] Various. ANTIC - DECEMBER 1985. San Francisco, California, USA: Antic Publishing, 1985. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. CES Buzz. That highlights this issue of ANTIC that hit the stands right before CES'85. What would Tramiel do? Perhaps an enhanced 800XL for 1985? Maybe a whole new direction for Atari computers. This issue has an interview with Jack Tramiel, then-chairman of Atari. Look over the predictions. How many came true? Sample question: "Are you actually saying that within three years Atari is going to market a small, user-friendly computers with the power of a VAX?" Of course, we know the history. But this interview defines it more clearly. Also, ANTIC's ever-popular Software Library. ON CONDITION: Very light bumping on outer corners. The binding is tight and seems a bit warped as this issue inserts a thick card into the binding. Also, some color fade on covers and slight browning on some interior pages. Visit

http://otakuboy.com
$8.00

[000053] Various. ANALOG COMPUTING - FEBRUARY 1985. Cherry Valley, Massachusetts, USA: Analog 400/800 Corporation, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. ANALOG Mag was one of those Atari Magazines that rolled on during 1985. And why not? The new Ataris were out and it looked like a new set of 16-bit machines based on Motorolas powerhouse 68000 were set to debut at January CES. Wow. Analog kept us all in suspense and in tune! In tune how? Well, how about this issue with all the programming exercise and examples, including the ever-popular Ask Mr. Forth. Not to mention the really cool adventure game -- programmed and ready for you to type in BASIC -- based on a writer's adventures at Vandenberg. ON CONDITION: Very slight bumping and wear on the outer corners. Otherwise, a very clean copy with vibrant color. Visit http://otakuboy.com
$8.25

[000057] Various. ENTER - JANUARY/FEBRUARY 1985. New York, New York, USA: Children's Television Workshop, 1985. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. For a short, short time, the Children's Television Workshop even got a bit of techno-buzz in the mid 1980s. ENTER was a magazine geared toward educating kids about the wonders computers. But what could have been a large, preachy magazine about how computers are changing classrooms, is really a neat sensa-wonder publication about super cool things to do with your computers. This ish? 1984-In-Review! The year's "Greats & Glitches". Also, a neat piece on which companies are producing the dreaded "Q*Bert Clones". Plus, a big feature on what laserdisc players are going to do to arcades. Remember Dragon's Lair? ON CONDITION: Shelf-wear along the spine on both covers and along top of front cover. Slight bump on lower right cover. Visit http://otakuboy.com
$8.00

[000074] Atari, Incorporated. ATARI PORTFOLIO QUICK REFERENCE CARD. Sunnyvale, California, Usa: Atari Coporation, 1989. First Edition. 12mo - over 6" - 7" tall. Very Good / No Jacket. Unpaginated - FOLD OUT - Atari was certainly dynamic, wasn't it. After first creating one of the most successful home videogame systems ever -- not to mention their wildly popular computers -- they go on to create a really sturdy PDA-before-there-were-PDAs. The Portfolio was a nifty little handheld that ran a very sturdy and clean version of DOS, all in memory, for a pretty decent price. People gobbled them up. It's sad that Atari was eventually gobbled up -- and with it any hopes of a newer/bigger/faster Portfolio. But now they're appearing at thrift stores and antique houses. And, blazes, many of them still work. Fortunately, this Atari Portfolio Quick Reference Card will get you up and running in no time. It covers all the apps -- the calculator, address book, diary/calendar, text editor and worksheet -- not to mention the Mini-Lotus-1-2-3 and all of its functions. ON CONDITION: One slight crease in the middle of the first fan-fold. Also a small bump on one upper, front cover. Visit http://otakuboy.com

$9.00

[000083] Various. COMPUTE!. Greensboro, North Carolina, USA: COMPUTE Publications, Incorporated, 1985. First Edition. 4to - over 9" - 12" tall. Soft Cover. Magazine. Very Good / No Jacket. The big mag that wrapped up all the computing news from the mid-80s? (I mean, of course, aside from those stuffy magazines like InfoWorld.) COMPUTE! It covered everything 8-bit: Atari, Apple, Commodore. This issue contains -- ahem -- "TURBOTAPE: SAVE AND LOAD CASSETTE AT DISK SPEEDS" for the Commodore 64 and Vic-20. Other features: a lamentation over 1984's CES (how sucky it was), "1984 revisited" visits the hi- and lo-lights, plus a bunch of classic game ads, include Bally/Midway's foray into home gaming, and a _really bad_ ad for Summer Games from EPYX. Also: Enhanced Applesoft input. ON CONDITION: Very nice. Slight foxing on the upper left front cover. Otherwise, clean with good color and crisp conditions. Visit http://otakuboy.com
$10.00

The JPeG format was designed for photographic images, as opposed to
computer artwork. The 16 grayshade skinny pixel mode is your best mode
for photographic images. So the slideshow program should automatically
offset each picture left and up to display the center 160 x 96 block,
or however big a block you can squeeze on the visible screen.

The slideshow should advance immediately on pushing the space bar, and
auto-advance after 45 seconds.

That's what I think!

On Fri, 26 Jan 2001 00:08:32 GMT, rjespino@yahoo.com wrote:

Graphics 9, which has 16 shades of one colour anyway. Still, very
nice effects in that demo, but graphically nothing the 8-bit wasn't
capable of out of the box.

> http://www.napri.sk/web/satantronic/Screens.htm

Fire and Plasma, again, Graphics 9. Big Chaos/Worms, graphics 0,
realtime redefined characters. The rest though are very impressive.
DLIs/HBIs? Altering the palette once or more per scanline, maybe?

> http://www.geocities.com/SiliconValley/Vista/6084/joyride1.gif

Not bad; 8 colours. DLI, probably.

> http://rak.isternet.sk/lego/gmg/products.htm

Okay, these guys know their stuff without a doubt.

> http://www.newbreedsoftware.com/bill/atari800/hip16tro.gif

I've seen this one. It's done with palette swapping every vsync.

It's okay. It screams "Blatant cash-in on retrogaming!" but by itself it's not bad. Buy it discount if you can; it isn't worth full sticker price by any means.

Same thing happened with my 800xl, turned out to be the power supply.
Corteze pointed me in the right direction on that one. I'd try a
different PSU before you go touching the chips (remember static
elctricity!).

Howdy Thomsen

>Is it posible to check out whenever the right or the left mouse button
>was pressed in combination with a Atari ST mouse w/o hardware
>modifications?

No it is not. You need a small modification (just one resistor somewhere, if you're lucky, you can press it into the connector that internally connects the mouse cable to the PCB) to be able to read out the right mouse button on the 8 bit Atari. The mod. is described in ABBUC magazin twice. (I believe one is on number 29).

905. 800 Keyboard

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-05 12:45:56 UTC
From: llpwhite@cs.com
Message-ID: <20010205074556.03774.00000815@ng-cj1.news.cs.com>
Source record: 38929

I recently acquired an 800. I got rid of my original 800 around 1985 when the 130XE's came out. Forgot how big these BIG these things are! But also re-confirmed my opinion that the stock 800's have the best displays of any Atari computer. It really is better than my "tricked-up" 130 or 800XL with the Super Video mods. But my real question: was there more than one keyboard used in the 800's? I don't remember my first 800 having the feel of this one (long stroke, very firm touch). Works great -- perhaps I've just forgotten after so many years of 130XE's.

I've said this so many times in the past that somebody is going to tell me to shut up!

The 800's keyboard was the best I've ever used. Period.

I'm settling for a couple of Focus 2001s to go with the PCs I have in the house now :).

Take care.

They did bring out a few different keyboards with the 800, just as in the
800XL I believe. However, I do think they were all of great quality, but I
could see there being a slight difference in feel.

910. Mercenary - Anybody have a copy that works with Atari800win ?

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-05 15:41:01 UTC
From: Richard Smith <rsmith@NOSPAMplaneteer.com>
Message-ID: <IdAf6.291$D3.2061@tor-nn1.netcom.ca>

> 2716 or 2732 chips?

Yes if you can get the burner to work. A lot of 3rd party outfits made 2764 EPROM cart boards for the Atari. In my experience rumaging around various surplus warehouses in Silly Con Valley, they were the most produced/easiest to find. They default to 16k ROM/2 EPROMs but this isn't a problem for most applications. It just means you have 8k less RAM on an expanded system which isn't a real problem. If it is a problem for your application, you just have to cut a trace or two on the cart circuit board, trivial.

912. PhillyClassic 2001 UPDATE: 02.05.2001

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-05 17:28:28 UTC

** PhillyClassic 2001, The East Coast Classic Gamer's Event! **
** http://www.phillyclassic.com **

** UPDATE: 02.04.2001 **

Tables are now * SOLD OUT *. Thanks to everyone who purchased one.
Just because you can't get a table doesn't mean you
shouldn't come! Be sure to attend and check out all sorts of
cool classic games!

The t-shirts are almost done and are going to go to the printer
soon! We think they look really cool!

The tournament list has been added to the PhillyClassic website!
Games range from the 2600 up to the Playstation 2! Each tournament
will be accompanied by a great prize package thanks to all our
sponsors!!

** UPDATE: 01.31.2001 **

Table spaces are becoming EXTREMELY limited so if you're planning
on attending and are debating getting a table, MAKE YOUR DECISION
SOON! :)

Randy Femrite is going to bring down all sorts of neat Jaguar
items to show off like a Jaguar Rotary Controller, Battlesphere,
Skyhammer, and a XE/Jag controller interface!

** UPDATE: 01.22.2001 **

Hasbro has sent us a lot of games to be given away at the
convention! Thanks Hasbro!

Michael Roberts has donated a TON of Star Wars handheld games
for us to give away at PhillyClassic. Thanks Michael!!

** UPDATE: 01.10.2001 **

Digital Press has graciously donated MANY Digital Press 6 guides
to be given away at PhillyClassic! Thanks Joe and everyone else
at DIGITAL PRESS!

We rented another 1000sq ft room for the convention, bringing the
total up to 3000 square feet!!

More and more sponsors are contacting us EVERY DAY meaning
more chances for everyone to leave PhillyClassic 2001
with a GREAT prize!

Classic Gaming Expo and PhillyClassic have teamed up to bring you the best gaming experience you can get on the east coast!

John Hardie and Sean Kelly are graciously donating items for us to give away at the convention. When you hear the names Hardie and Kelly, you know they've gotta be good!

Ticket prices are currently $6 in advance, and $7.50 at the door. Tables to setup your goodies on are $10 per table. Tickets will be on preorder until March 30th, 2001. Just remember, we're a non-profit event, every cent we make on PhillyClassic goes right back into the convention!

This year's tickets are pretty nifty! Marc has made Intellivision carts into our tickets that hang from you neck! Really neat!

** UPDATE: 12.23.2000 **

Sponsors are pouring in, which means more chances for everyone to walk away from the convention with a great FREE item!!

T-shirts will soon be available for pre-order. These spiffy shirts feature the PhillyClassic logo and some classic game logos! Be sure to put an order in as soon as they're available!

Randy Crihfield of Hozer Video Games has donated some new Atari 2600 games to be given away! Thanks Randy!

Jeff Folejewski will be bringing MANY (as in more than 5) full-size coin-op arcade games! All games will be set on free-play and a tournament will be held on his Joust machine!

Good Deal Games has also chosen to donate some of their new Sega CD games to be given away at PhillyClassic! Thanks Good Deal Games!!

** UPDATE: 10.30.2000 **

Van Burnham, editor of Wired magazine and author of Supercade (www.supercade.com) has confirmed she will be attending PhillyClassic! She's a great video game buff and a wonderful person to talk to!

Be sure to bring all your spare games and systems, we will be holding another auction this year! Last year people who auctioned items off made a LOT of money, and it's a good way to part out some of the extra items you don't need!

** UPDATE: 10.15.2000 **

Chad Schell of Schell's Electronics has donated an Intellicart to be given away as a prize at PhillyClassic!! Thanks Chad!

Tickets for PhillyClassic are now on sale!! The price for admission is $6 for both days, and $10 per table you wish to use to setup on. Just remember, any money taken in from the attendees is not used

as profit for any of the organizers; it's used to pay for everything
used to setup the event. In case of any spill over money it will be
used towards next years event!!

If you have any items in particular you're wanting to pick up or to
part with, be sure to e-mail Jeff Folejewski and let him know so he
can add your list to our PhillyClassic webpage!

** INITIAL POST: 9.26.2000 **

David Newman, Chuck Whitby, Marc Pallante, and Jeff Folejewski
are proud to present PhillyClassic 2001!! The first
PhillyClassic was such a success we had no choice but to do it again!
This year's event promises to be nothing but BIGGER and BETTER!

Website is now up and LIVE, complete with:
* Information/scheduled events
* Hotel accomodation info/online reservations
* Driving directions and interactive maps
* Ticket information
* How To Link to Us banners/ads available for
YOUR classic game related site!

The weekend of April 20th and 21st will be one to remember as classic
gamers unite for a weekend of hardcore gaming!

Planned events include casual trading/selling, *tournaments*,
auction, show-and-tell, a guest speaker or two, and a
general good time by all!

We have rented a 2000! sq ft conference room at the Sheraton
Suites for the event, which means enough room for a lot of
people to come and setup the pride and joy of their collections,
and even a little tradebait!

The tentative times are as follows:

Friday: 5pm - ?? -- First Day, Setup, Meet and Greet, Informal
Trading and Game Playing
Saturday: 9am - 5:00pm -- MAIN DAY

If you have any questions about the event, PLEASE e-mail:
David Newman (davidnewman@adelphia.net)
Chuck Whitby (intv-sama@worldnet.att.net)
Jeff Folejewski (adventurevision@yahoo.com)
Marc Pallante (marc@classicgamer.net)

If you plan on attending, please
purchase your tickets early and make those hotel reservations!

Thank you very much!

There were at least 2 types of keyboard in the 800 over here in the UK, as I have found out when trying to repair them, the keys are the same to look at, but the spacing under the keys is different re the shift keys in particular. They are both good, but certainly not the same in action

Not having an XL/XE schematic anymore, I'd appreciate it if someone who did could post the pinout for the 6502C cpu.

918. Floppy Board

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-05 23:18:20 UTC
From: "David\\Julie Wilson" <cybrslider@home.com>
Message-ID: <0xGf6.50170$bb.936136@news1.rdc1.tx.home.com>
Source record: 38942

Hello all,

Does anyone have a Black Box with a Floppy board installed that they have successfully used a standard 3.5 floppy drive with? The BB "recognizes" a drive is there but I can't format, read, or write to the drive. I have tried 3 drives to no avail. I put the ribbon cable together as described in the manual. It looks good. I've tried all the jumper settings on the drive, all of the device settings on the BB (i.e., D0, D1, etc.) but all I can get out of the BB Floppy formatter is 'Write Protected or Bad Disk'. I've tried disks that were already formatted with a PC, out of the box new disks, old disks, black disks, grey ones, etc.

Oh yeah, I did check the disks. They were not write protected.

I appreciate the help! Thanks

David

I've never seen any KB variation; I think you have just forgotten its really excellent quality. It was even better when you upgraded from a 400. That 800 is still my model of choice for color brightness also, even on a plain RF TV!

Source record: 38946

Does anyone know if Justin Wilder is still around anywhere? I had found his Disk Mend from Sep '85 on a web page and used it when double density was needed. He basically did a rewrite of Analog's Disk Tool by Tony Messina and produced a very capable sector editor and general disk utility. If Mr Wilder is still around, we would like to send him some added mods like the disassembler.

extract from the docs:
> A 1953 graduate of the University of Michigan, Justin E. Wilder is a Senior Project Engineer for Johnson Controls, Inc. He purchased his Atari 800 in 1980, and his Ultimate Renumber Utility was in the Atari Program Exchange. He's a member of Indiana-Michigan Atari Group Exchange (IMAGE) users' group.>

Don't believe so; OSS started with the orange in mag ads of '83 and then I think some grey before the black with yellow labels. Not completely certain how many ROM revisions existed.

My bad...I should've put my question under the part about the EPROM's....I
meant to ask if the 2764 chips could be used to burn a 2600 game or is the
2600 going to need the older 2702/2704/2708/2716 chips for the machine to
read in the program from the chip?

Or somebody could develope a USB interface for the Atari 8 bit. This way you
don't need an APE or SIO2PC cable. Just a USB2USB cable. Which can be had
everywhere.

Howdy Bill, folks

>Now if only we could do full motion video out of them! >:^)

In one of the C=Hacking issues (It's an online magazin for the C64 and C128 community) there was an article about real time video.

Now if the C64 with it's 0.9xx MHz processor can do it, why not the Atari at roughly twice that speed.

CU Mathy van Nisselroy

PS the article was IIRC by Nate Dannenberg, which is a well known hardware developer. He even commected a webcam/netcam (parallelport version) to his C64.

Howdy Andreas, folks

>the only A8 game (I know) which supports the right mouse button is
>Bombdown. A german Minesweep/er clone... -Andreas
>
>P.S. Maybe there are more games, but most software works with one mouse
>button (A8 joysticks also have merely one button!)...

There was a version of Operation Blood (on other computers known as Operation Wolf) by ANG software that will work with the ST mouse. IIRC there where two versions, one worked with joystick and mouse, the other worked with the lightgun.

There are probably more games by ANG (try Best Electronics or MArkus Romer, Andreas should know more about where ANG software can be had) that can use the mouse.

Two mouse buttons are nice to have in games like Bombdown. One button was for 'I think this is not a bomb', the other for 'I think this is a bomb' IIRC.

Ugh! Lou strikes again. I see he still lives in PA. He tried to rip me off several years ago. I eventually contacted him by phone and he shipped me the items. The games were in bad shape. The Neo*Geo CD worked ok. The guy shipped the unit in the original box without any packing materials. The unit got banged up a bit and when I opened the box the CD lid had sprung. I was able to snap it back together. I had sent him a money order for the items. I waited over two months before contacting him by phone. I had no other choice as he had dropped his email account. I was able to get his number by calling information and giving the phone company the mailing address. He did not show any sign of remorse, he gave me a lame excuse that a friend had borrowed the system. A couple years later he denied ever doing business with me until I refreshed his memory with all of the little details, even then he said that everything was in good shape and that even though the game discs were full of scratches I should not care since the games still worked. He is not to be trusted.

Nope, never saw it in real or naughty form and I think I have seen an
awful lot of titles over the years. Having had a mega collection of
titles myself and worked for a major UK Atari dealer throughout the
8bits lifetime, reviewed for Atari User *and* had fairly good links
with the UK crackers of the time I really can't think what he had?

Did you ever see it running on an 8bit Atari?

I only ever saw it on the C64..

I pulled an old Atari 400 out of the attic, seems to work but can't get joystick to work in no.1 slot, found eight (PacMAn, Missle Command, Space Invaders, Centipede, ET Phone Home, DonkeyKong, Star Raiders, and a Bascic Computing Language) working atari original cartridges with it but the second source cartriges (Coconuts, Atlantis, Frogger,Jungle Hunt, Q-Bert, Congo Bongo, andBig Five Software Cartridge of Miner2020?) don't seem to work or I don't remember how.
Is there any thing I can do with it?

Hello paul, hows the atari going, keep the faith

Anyway re: gunship on the a8

I remember microprose doing some ad's for an a8 version, don't ask me where, they might have released it in eu but not uk,

just out of interest which MAJOR uk atari dealer did you work for, was it sillica shop (UK's biggest) or was it atari world/software express or the firm, i think they were in leicester called A+B computers or something, or possibly chips in worthing (Uk distributors of 1050 isp u/g) these are the only ones i remember or know of

yours atarily

> read in the program from the chip?

It would probably be the way to go. The older chips are actually more pricey
then the newer ones and they required some odd programming voltages. It
would need an adapter of course to account for the different number of pins
and take care of extra address lines.

How someone did it would just be a matter of style. I remember one
design<not for carts> I did just used one of those 4 slide switches in an 8
pin dip to select one of 16 binary weighted outputs. One of the guys I
worked with just looked down and spit on the ground<embellished but not by
much>, not very tolerant of any style but his own. His weapon of choice was
~$15 thumb wheel switch with numerical readout and binary output pins.

Hi guys.
I have a 2600 in great condition. comes with power cord, tv cord, and two joysticks.
comes with these carts.
Dragon fire
centipede
star raiders (with manual)
combat
frogger
venture
space invaders (with manual)
Raiders of the Lost ark (with manual)
super breakout
ET
Mario Bros.
Warlords (with manual)
Spider Fighter
Superman
Pacman
Baseball (with manual)
video pinball
berzerk
bangaroo
stampede
defender
deamons to diamonds (with manual)
deadly duck (with manual)
fishing derby
vanguard

Please email me with an offer.

The SIO2ST and the SIO2PC are actually the same cable. There is a program that allows a Falcon, TT or one of the clones to be hooked up to a 130XE or an 800 XL computer. The Atari computer would then be a file server for the 8-bit computer. I am not sure if the program works with a ST, but it would be worth a try. It might work. The Xfomer cable, which I have also, allows hook up of an 8-bit drive to a ST using the Atari version of the Xformer 8-bit emulator. I have done this many times with great success.

I'd suggest the joystick may be the problem.
It is easy to open it up and see if any of the wires have come undone
from the pins they go on.
Then you might also plug in the BASIC cart you have and type
something like.
10 X=STICK(0)
(STICK(0) reads joyport 1)
20 Y=STRIG(0)
(STRIG(0) reads fire button of joyport 1)
30 ? X,Y
40 GOTO 10
You should get 15 0 until you move the stick or press the button.
The button should make the second number = 1.
Left 11
Right 7
down 13
Up 14.
and other numbers for diagonals.
Good Luck
Russg

HAHA! I haven't heard that name in a long time :) Someone probably
tracked him down and put him out of his misery.

Remember the bot that posted all the old Atari computers he had for
sale once a month? He used to post the original retail price and then
his price which was like $100 less.

I used to love reading about all his millions of dollars, Rolls Royce
cars ect. The best part was all the lawsuits. He'd screw someone and
when they complained he'd claim to have a lawsuit pending against
them.

Someone did a good job tracking him down. They put up a message forum
devoted to him along with pictures of his run down parents house
(where he lives) along with a picture of his Rolls Royce...an 80's
Mustang on blocks. They even had police mug shots of him online along
with his entire police record.

I kinda miss the entertainment he brought to these newgroups.

Well I did a review of the Microprose lineup at the time for a mag and
Gunship wasn't in it, I got back preview disks and a nice thank you
from them afterwards and still no sign.

>just out of interest which MAJOR uk atari dealer did you work for, was
>it sillica shop (UK's biggest) or was it atari world/software express

Nope, not Silica, Maplin ...We had a good connection with Atari as 1.
they were just down the road in Slough and 2. we hosted an Atari mag
as well. The fact we brought shed loads of hardware from them also
might have made a good impact too :-)

It's through Maplin that I ended up writing for Atari User, they
needed a tech manual and guess who was tech Atari sales :-)

Maplin were big dealers for the 8bit at the time although the buyer
for all the shops called Ron made a terrible hash of stock quantities
so we had mountains of Temple of Apshai's doing nothing (I used them
for blanks in the end). Maplin also had the ability unlike other
places to offer 3rd party ram upgrades and in house electronic
projects like digitisers etc.

Some of the big Atari folk were also customers, Adam Billyard of
Elektra & Chop suey fame often demo'ed bits like Bellum in the shop
and a certain Mr Mclean purchased his 810 there :-)

955. I'm singing the Atari800Win Booting Blues

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-08 03:31:57 UTC
From: Jamn
Message-ID: <Poog6.1454$D3.5621@tor-nn1.netcom.ca>
Source record: 38879

Hello All;

I have an issue with Atari800win 2.6c, Atari800Winplus 2.7 and 2.7b and booting some double density disk images in .atr format.

I have been able to successfully convert some atari disks over to .atr format. The atari disks were in double density format, consisting of SpartaDos 3.2d, and MyDOS 4.5.

The .atr images are double density, 180k in size each, and boot fine under Atari800Win 2.5c.

When I attempt to boot them under the above "problem" programs, the SparaDOS disk crashes the emulator (ala pop up crash message), and the MYDOS disk gives me continuous boot error messages.

Other images in Density 1 and 1.5 seem to boot fine.

I have converted several disks in the past using my 5 1/4" PC drive with no problems until now. All of my images run fine under 2.5c, however, I like the faster disk I/O (without SIO turned on) of the newer emulator versions.

I am curious if anyone else has seen this problem before, or if anyone is interested in testing my disk images on their set-up. I can e-mail them upon request.

Thanks in advance for your ideas.

Regards,

...Jamn

I dunno... shipping? I've got a boxed 600XL with no power supply, and
I'm sure I'll run across an 800XL someday, but if you'll let it go for
the cost of shipping, I'll take it.

Thanks,

Max

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

Heck, I remember a similar incident back before there was a group.

Mr. "Starfleet" horned in on a conversation some guys were having on a
netted Carina BBS about combo floppy drives (the 3.5" and 5.25" in one unit)
and Terry said he could get them for some ridiculously high price. When
somebody complained that the price was too high, Terry threw the usual
tantrum.

But let's not talk too much about him. He may reappear :)

I just picked up a used black box. I didn't get any docs, but I have found the CSS web pages.

My question concerns the power for the board. The power connector is unique. To see a couple of pictures go here:

http://cerebro.cs.xu.edu/~ryanr/atari/blackbox/blackbox.html

Did the Black Box come with its own power supply? How do I provide power to the board?

-Bob

> First ofall, I would get it repaired. It is too good of a
> computer/game machine to have it just rot in an attic.

What?!? If it IS broken , and you DO want to use your Atari, it will be far cheaper for you to get another Atari computer than to get the Atari 400 fixed. Post a message, or look on eBay. Get an 800XL or something, it has 64K RAM and a REAL keyboard (just for starters!).

Your cartridges are probably just dirty. Clean of the contacts and they will probably work again.

964. about some games

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-09 08:45:05 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3A83AE10.283993AC@siemens.at>
Source record: 38888

Hi,

Some games I liked most in the good old days are never mentioned here.
So here's some questions on them :

Spy's demise (Penguin) :

I've never figured out the meaning of the secret messages and I found
no clue in the manual. Anybody out there able to enlighten me ?

Rails West and Fortress (both SSI) :

Of these I never have been able to get hold of the originals.
I still would like to buy them if available anywhere. If not, does
anybody know where I could get at least the manuals ?

Gerhard

965. Some questions

Newsgroup: comp.sys.atari.8bit

Message-ID: <20010209051909.07438.00000135@ng-cp1.aol.com>
Source record: 38889

Can anyone help me with these - I'm trying to amalgamate several busted machines into one good one...

Can I prise off the keys on an XE to clean them up? They seem very firmly attached and I don't want to break them.

What supply and polarity does the XL-style disk drive need (1050?).

Is there anywhere I can get SIO cables? I'm in the UK.

Thanks everyone!

966. How to remove motherboard from 800xl case

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-09 12:02:16 UTC
From: ronfucci@my-deja.com
Message-ID: <960m84$n6b$1@nnrp1.deja.com>
Source record: 38890

It's easy enough to remove the keyboard, but I can't see how to remove the motherboard from the case. I want to replace the OS rom. It appears that the metal protective shield over the motherboard attaches from the bottom of the motherboard with screws. How is the motherboard anchored to the case ? Thanks for any help.

Source record: 38891

When you have the case opened up and the keyboard removed, there may be some screws that go through the metal shield, through the mother board, into the bottom of the case. There are also at least two screws that go through the motherboard only. On the one I'm looking at, there is one screw between the joystick ports and one by the power supply port. There are no screw holes underneath the metal shield. The one I'm looking at doesn't have any screws to hold the metal shield together. I can't recall for sure if any go down through the motherboard from the top. Of course, if you see only screw threads protruding up through the shield, then there aren't any that go down into the case. Hope this helps.

Source record: 38892

Yes, the BB did come with it's own power supply. Here are the specs on the one that came with my BB:

120VAC 60 HZ .45A

Pin 1 ground
Pin 2 ground
Pin 3 +5v DC 1.8A
Pin 4 -5V DC .05A
Pin 5 NC
Pin 6 12V DC .5A

The connector on the end that plugs into the BB looks much like a standard PC power supply connector BUT it is not. I can't describe it very well. The connector attached to the BB is flat on the top. On the underside, it is flat up to the end and then it has a kind of 'hook' at the end on the underside. The connector on the power supply has the is the same thing basically. It is made to lock into the power connector on the BB. I don't know which pins are used from the power supply. The wires coming out of the power supply that hook up to the connector are (as the wires are facing you) Blue, Red, Black, White. That is the way they hook into the connector on the BB. I would guess that wires from different power supplies are different. I'm no electronics person by any means.

Message-ID: <3A840114.D2480F75@mail.uni-mainz.de>
Source record: 38896

Well,
I guess it was me who wrote that list. Thats what I remember at the
moment (old and lazy brain):

- Shanghai (Activision)
- Geisterschloss (KE-Soft, PD now!)
- The Brundles (KE-Soft)
- The Brundles Editor (KE-Soft, PD now!)
- Minesweeper (Power per Post)
- Bombdown (Roemer of Uno); PD-demo avaiable!
- Operation Blood (ANG/Mirage)
- Operation Blood II/Special Forces (ANG/Mirage)
- many PD programs from KE-Soft`s ZONG magazine
(10-12 little programs)
- some PD programs from Bellcom library (KK...)
- a little calculator from AMC Verlag (PD)
- another calculator - more professional (PD)
- Multi-Mouse System (PD)
- MOS - Multi-Operating System (from ABBUC magazine)
- Mouse Utility Disk (many drivers from KE-Soft,
now PD)
- G.O.E. (Graphic Operating Environment; PD)
- Diamond GOS (version 1, 2 and 3; freeware now!)
- BOSS-XE and BOSS-X (Freeware now!)
- many more PD programs I do not remember right now...
(some 3-5 programs from my friend Highlander Soft)

Maybe someone can create a list that covers a) all known Mouse programs,
b) Paddle programs, c) Lightgun/Pen programs d) Touch Tablet/Koala Pad
programs,
e) CX-85 numeric key programs f) programs for other input devices (Sega
controller, VCS Keypad, Trackball, etc.) This list would not be so big,
since most programs were/are written for Joystick or Keyboard...
-Andreas

Well,
why not ask me for a PD disk ?!? I have collected some programs for
Koala Pad and/or Atari Touch Tablet. All programs can be found on one
Medium/Dual density disk (2 sides) and are -to my knowledge- PD. Most
programs are of course painting tools or Paddle programs that also work
with the Koala Pad... -Andreas

P.S.: Just email me, if you are interested. I also have a disk full of
mouse programs, another one full of Paddle programs and a last one full
of Lightgun/Lightpen programs... (no Trackball or CX-85 PD disk yet!)

The images are indeed 184336 bytes in length. And so, I think you're on to something. Strange that they work in 2.5c tho...

So my question now is, how to I create and blank DD atr image that I can use?

I would say that 95% of the U.S. models were socketed. The only soldered ones that I have seen were from Taiwan -- some of the last 800XL's produced.

983. Re: a8jdpeg: JPEG viewer for the Atari 8-bit version 2

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-10 07:08:00 UTC
From: w_a_lang <w_a_lang@willinet.net>
Message-ID: <t89q643cm7qr5f@corp.supernews.com>
Source record: 38807

Hello Raphael James Espino,

I was looking thru one of these Atari 8-bit newsgroups where
I read the title "a8jdpeg: JPEG viewer for the Atari 8-bit
version 2" which I clicked on it to find out the information.

Unfortunately it was "timed-out" for me.

By the way I still have my Atari 800XL Computer stored in
a protective storage box inside a cool dry closet.

I have worked hard to preserve my software for that system
while I have "advanced" on to a Win95 Pentium PC.

If you have a8jdpeg available as a download than please
post here the web site address to download it.

If this JPEG viewer for the Atari 8-bit is merely stored on
your hard drive and not at a web site, than please post it in
the alt.binaries.comp.atari8bit newsgroup.

I would like to have a8jdpeg on file just in case I might need
it.

Thank you very much,

Wally

Yes, I did... that's why I said I'm sure it wasn't any other one.
Tried it for a little while at his some too. And my cousin-in-law
was with me that day, so he saw it too (but wasn't interested in
it at that time, either).
That friend was German. Maybe he got it in one of his travels?

Ah, yes! I remember those last 5% well!

I used to do RAM upgrades and other modifications to the Atari
8-bits. Having set a price based on all the chips being socketed I was
surpised when I got the first one without sockets. After desoldering all
the RAM chips and installing sockets I thinkI made about 25 cents an hour
on that one!!!

>
>Is the hyper-modern version of Centipede by Hasbro worth playing?

I bought that, mostly for the Atari logo I guess. Before Hasbro went and distorted the Fuji symbol, what was the point of that? Anyway, I found the "adventure" game, which is most of what you get, to be entertaining for a while. There's also a 3-D version of the original game, where the 2D playfield is sort of tilted away from you at 45 degrees. I think I found that more fun than the adventure.

The game also won't install on my own PC, an AMD K6-350, but that may just be my particular PC.

Voor belangstellende nederlandse Atari achtbitters heb ik nog wat spullen dit ik zelf eigenlijk niet meer nodig heb. Misschien zit jij er om te springen?

Dingen zoals 2 1050's, een 600XL, ATIN Centronics printer interface, SIO2PC interface, etc....

Wie met een goed verhaal komt kan deze in principe "gratis lenen", of tegen een kleine vergoeding, iets leuks te ruil enz. enz.

Misschien heeft iemand nog een Schneider Euro PC (of XT/AT) te ruil (die zoek ik nog voor aan de wand :-) (ja, echt.....)

Groeten,

Richard

I own two Black-boxes that use an PC powersupply, but I have other voltages:

GND +5V +12V -12V and NO -5V. This voltage is only used for the RS232C port.
It would work with +5V and -5V but the original specs would need +12V
and -12V/

When using a PC powersupply you can also use it for you computer and
harddisk(s). My BBS run's for 3 years now stable on a PC powersupply 130XE

I have done this several times with my 130XE/65XE and 800XE computers never had an keyboard that could not be cleaned.

The most fragile on a XE keyboard is the flat cable that connects it to the motherboard.

Hi all,

If you haven't noticed, the GOTCHA (Gaming Obsession Throughout Computer History Association) website has been down for over a week. This is because my (X) host, Emuclassics, has been down for that long and is still down. You can imagine how upset I am about this!

I have just completed the move to ClassicGaming.com. GOTCHA's new address is:

http://www.classicgaming.com/gotcha

Please update any links you have to my site and please help spread the word about the move. It's very disturbing to lose a home you've lived in for over two years...even if it is a digital home.

For those unfamiliar with GOTCHA, it is the home of:

The GOTCHA Awards
The Official Computer Game Collector's List
The Complete list of EA Flat Box Games (and box scans)
Much, much more...

Thank you in advance,
Hugh

As per several requests, here is a listing of the ATR-8000 SIG
(Printed)Newsletters:

1)(Jan84)MYDOS patches(3.12/3.08), DDINIT help.

2)(Feb84)Copwer software ready for CP/M ramdisk, ZCPR, Using UC1: for BBS,
Dual console BYE, Programs compatible with CPM 2.2, drive rate.

3)(Mar84)More ZCPR, MYDOS 3.16/3.011, Replacing Z80 CTC chip relating to
ATR disk errors and A8 error 140, download code to ATR, using 850 as CPM BBS
with up to 3 ATRs(3 BBSes at once).

4)(Apr84)450 baud from 300 baud modem, MSDOS on DS disk, 80 column ATRMONs,
issue 3 error.

5)(May84)Copower now made for 11 CPM systems, MSDOS 2.1, DT-80 atrmon cart,
RBBS package, MYDOS 3.18/3.013, searching for reliable 9600 baud modem
program.

6)(Jun84)Omnimon, Ramrod, RDOS-MYDOS runs under BXL cart. CPM lib has 73
disks(bright stars 8").

7)(Jul84)Omniview, using Atari with 2 ATRs+4 modems& copwer.

8)(Aug84)Lightning strike takes out ATR system but not Atari, protection,
MSDOS gets folders like MYDOS, New CPM and fixes, ZCPR3.

9)(Sep84)Rev:Word Machine, CPM 2.2 and 1 drive, Big Board disk 10-utilities.

10)(Oct84)Copower, ATR overview, C64 version of Atr(and others?), hard drive
soon, SC622 disassembler, ZCPR.

11)(Nov84)Bit 3 80 column card(800), Flight Sim II, Chameleon, 8" drives.

12)(Jan85)ATR8500-hot new changes, hard disk, Copower Plus, RBBS clock
software, 90 disk CPMUG Lib, write errors on copy.

13)(Aug85)ATR-8000-an Atari peripheral device, uses for ATR in CPM mode,
copower-cpm86 & 1 meg of ram.

14)(Oct85)Using CPM, nsweep, reconfiguring the atr and drives.

15)(Nov85)Comparing MYDOS to Nsweep, a little on the 8500.

16)(Feb86)Letters and Answers.

Thats it.

I have opened up many, many 800XLs, to upgrade and repair, and found that
if there is a combination of socketed and not, Atari did it. If the
socket was available, it got put in, other wise the chip got soldered in.
No way to tell except to open it.

Retrotaku / Zer0-Byte Bookstore offers the following antique computer and videogame books for purchase.

If you are interested in any of the titles, please send an e-mail to retrotaku@otakuboy.com to inquire about availability, or if you have any questions. Full purchase terms are available on the web site: http://www.otakuboy.com

Thank you for perusing the list.

[000098] Winston, Patrick H.; Prendergast, Karen A. (Editors). THE AI BUSINESS - COMMERCIAL USES OF ARTIFICIAL INTELLIGENCE. Cambridge, Massachusetts, USA: The MIT Press, 1984. First Edition. 8vo - over 7" - 9" tall. Cloth. Very Good / Good. Many books on artificial intelligence are couched in theory, what could be. But THE AI BUSINESS is not focused on what could be, they focus on what can be -- for the most part. This book is about commericial applications of then-current Artificial Intelligence programs. What's especially neat about the book is many people from well knowns companies like Atari and IBM wrote these essays. There are also histories of various programming languages and applications, including XCON, Caduceus, WAVE, and PUMA. Also, Artificial Intelligence and Gaming! ON CONDITION: Book is in good, clean condition. The dust jacket is a bit banged up. The light pencil marks on the interior, front end-papers. Have not found marks inside the book.
$12.75

[000003] Sippl, Charles J. , Roger J.. Computer Dictionary & Handbook. Indianapolis, In, Usa: Howard W. Sams, 1980. 3rd Edition. 8vo - over 7" - 9" tall. Hard Cover. Very Good / No Jacket. Large dictionary of computer terms. Contains a vast introduction to computers and various languages of the time. Of large interest to someone who wants definitions of computer terms from the era -- programmers of classic systems, early languages, obsolete CPUs, etc. Contains a few predictions on the future of computers. ON CONDITION: Back cover has very light, vertical scuffle mark along height. Upper right corner of back cover has small marks where adhesive glue affixed original price tag. Upper left corner of back cover is pressed. To the left of the title page is a small punch mark into the binding, which is not visible elsewhere. Otherwise, general shelf-wear. Visit http://otakuboy.com
$11.50

[000005] Scanlon, Leo J.. 6502 SOFTWARE DESIGN. Indianapolis, In, Usa: Howard W. Sams, 1980. First Edition. 8vo - over 7" - 9" tall. Soft Cover. Fair / No Jacket. A very good introduction to the 6502 microprocessor, a popular 8-bit chip in the early 1980s, used in _many_ computer systems including a number of Apple systems, the Commodore 64 and the Nintendo Entertainment System. Great

information on pinouts, how to address the chip, register controls, and much more. Listed as a 6502.org MUST-READ. ON CONDITION: Shelf-worn and creased on many pages. A number of pages were held together via paper-clips. (Grrr..) Many of the passages are highlighted and there are some pencil notes here and there.
$8.00

[000026] Glossbrenner, Alfred. THE COMPLETE HANDBOOK OF PERSONAL COMPUTER COMMUNICATIONS. New York, New York, USA: St. Martin's Press, 1983. First Trade. 8vo - over 7" - 9" tall. Hard Cover. Very Good / Good. Special Edition, printed for industry. This book explains how to get online and get into the wonderful world of BBSs, circa 1983. If you remember the computers from the time -- XT, Commodore 64, Apple // series, CoCo, etc. Goes into remarkable detail on the services of the time, the various communications protocols in-use and upcoming. ON CONDITION: Spine upper and lower edges are bent from shelf placement. Dust jacket creased along edges. Also, a "Compliments of Hayes" sticker is affixed on front, but this may not be a defect, depending on your opinion. First page is stamped with a "from the library of" stamp. Visit http://otakuboy.com
$9.00

[000028] Williamson, Mickey. ARTIFICIAL INTELLIGENCE FOR MICROCOMPUTERS. New York, New York, USA: Brady Communications Company, Inc., 1986. First Edition. 8vo - over 7" - 9" tall. Half-Leather. Text Book. Very Good / No Jacket. Ready to turn your business into an AI heaven? Want to walk into the office and hear, "Hello, Commander. Computer reporting". This book will explain the 1986-state of AI and where it's going. The focus, as I said, is how you can use it in your business. ON CONDITION: One dent on upper spine and slight wearing on spine where it connects to front cover. Very clean. Visit http://otakuboy.com
$7.00

[000029] McClellan, Stephen T.. THE COMING COMPUTER INDUSTRY SHAKEOUT. New York, New York, USA: John Wiley & Sons, 1984. First Edition. 8vo - over 7" - 9" tall. Hard Cover. Very Good / Fair. A really neat tour of the computer industry in the early 80s. All the old favorites and players are here, from AT&T and IBM and DEC to Commodore, Atari, Tandy, Apple (right on the cusp of the Macintosh birth, no less!!!) . Mr. McClellen is warning you, though. "THE COMPUTER INDUSTRY IS GONNA FREAK!" Turns out, he was partly right. ON CONDITION: The dust jacket has bent and slightly creased along its edges. The front of the jacket is foil-stamped, and some of the foil has flecked off in tiny areas and tarnished on one part of the back jacket. Also, bottom left of back jacket has its coating torn, harming some of the text underneath. Book itself has slight shelf-wear on bottom of spine. Visit http://otakuboy.com
$8.00

[000030] Martin, James. DESIGN AND STRATEGY FOR DISTRIBUTED DATA PROCESSING. Englewood Cliffs, New Jersey, Usa: Prentice Hall, 1981. First Edition (?). 8vo - over 7" - 9" tall. Hard Cover. Text Book. Good / Fair. Is James Martin a MAGICIAN? ! You might think so, especially if you check out the picture of him

on the back in Conjure-pose. Here he is in a book (one of many) where he extolls of the virtues (in excrutiating detail) of distributed computing. And, yes, this is way before SETI, way before multi-processing PCs running Windows 2000. So, this guy just might be a magician or at least some kind of prophet. ON CONDITION: Dust jacket is creased and torn around edges. It is intact. Books seems to have been stored at an angle. As such, the whole of the book is twisted a bit on the spine. No pages are torn, but the spine has no doubt weakened. Visit http://otakuboy.com
$8.00

[000031] Schreiber, Linda M.. ADVANCED PROGRAMMING TECHNIQUES FOR YOUR ATARI. Blue Ridge Summit, Pennsylvania, USA: Tab Books, 1983. First Edition. 8vo - over 7&#65533;" - 9&#65533;" tall. Soft Cover. Very Good / No Jacket. A very nuts-and-bolts Atari programming book geared toward Atari's first foray into the world of home PCs -- the Atari 400 and 800s. Covers graphics (ANTIC, specifically) , animation, voice programs, BASIC, disk drive usage, among other things. Includes some nifty programs. And remember: All this can be typed write into one of those Atari 8-bit emulators about the Net. Has a nifty pic of an Atari 800 on the front cover. ON CONDITION: Edge-wear and shelf-worn. Mainly light creasing along spine edges. Otherwise, very clean. Visit http://otakuboy.com
$15.00

[000032] Allan, Boris. POCKET GUIDE: LOGO. Bath, England, United Kingdom: Pitman Publishing, 1984. First Edition. 32mo - over 4" - 5" tall. Spiral. Very Good / No Jacket. A pocket reference guide for that grand, old, "easy" language LOGO. You remember; the one with the turtles that drew lines across your screen. Old programmers know that LOGO is a powerful language with a deceptively simple syntax. This booklet references the entire language. Get the book, download a development environment like WinLogo, and go to town. ON CONDITION: Portion of the original price tag is on front. A minor bubble on the back panel and some light pencil marks on back panel. Visit http://otakuboy.com
$11.00

[000033] Stine, Megan and H. William. MICRO ADVENTURE NO. 2 JUNGLE QUEST. New York, New York, USA: Scholastic, 1984. First Edition. 12mo - over 6&#65533;" - 7&#65533;" tall. Mass Market Paperback. Good / No Jacket. Scarce - 1984 -- Computers were "the future" and kids could have it all for them if they'd just learn how to program. This books brings kids through an adventure in which small BASIC programs kids would enter into computers from the era woud help save the world! ON CONDITION: Slight creases down edge of spine and front cover. Another crease near the spine on the front cover. Both creases crawl along the length of the book. Small dent in the upper back cover. Otherwise, general shelf-wear. Visit http://otakuboy.com
$11.00

[000038] Conway, Gerry. ATARI FORCE #11 "By Blackjak Betrayed!". ill. Lopez, Jose Luis Garcia. New York, New York, USA: DC Comics, 1984. First Edition. 4to - over 9&#65533;" - 12" tall. Saddle Stitched. Very Good / No Jacket. Long live ATARI FORCE! During the first set of videogame heydeys, Atari and DC Comics teamed up to bring a set of stories to the comics pages. Mini-Atari Force issues were

distributed with some games. In the comics shops, full-size issues were available with a continuing storyline. In this issue, Blackjak betrays the Force ... But WHY? ON CONDITION: Very small creases near edges of stapes. Otherwise, pretty clean. Color is good. Visit http://otakuboy.com
$8.00

[000039] Conway, Gerry. ATARI FORCE #2 - "Dart Vs. the Warbeast". ill. Lopez, Jose Luis Garcia. New York, New York, USA: DC Comics, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Very Good / No Jacket. Long live ATARI FORCE! During the first set of videogame heydeys, Atari and DC Comics teamed up to bring a set of stories to the comics pages. Mini-Atari Force issues were distributed with some games. In the comics shops, full-size issues were available with a continuing storyline. In this issue, we meet some of the team's mortal enemies. Also has a profile of "Champion". BONUS: Ad for TREASURES OF TARMIN for the Intellivision. ON CONDITION: Some light creases around covers, mostly around edges of staples.Visit http://otakuboy.com
$8.00

[000040] Conway, Gerry. ATARI FORCE #3 - "Pakrat Goes WILD!". ill. Lopez, Jose Luis Garcia. New York, New York, USA: DC Comics, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Very Good / No Jacket. Long live ATARI FORCE! During the first set of videogame heydeys, Atari and DC Comics teamed up to bring a set of stories to the comics pages. Mini-Atari Force issues were distributed with some games. In the comics shops, full-size issues were available with a continuing storyline. In this issue, we meet some of the team's mortal enemies. Also has profiles of "Dart", "Babe", "Morphea". BONUS: Full of ads for classic videogames: Frogger, Q*Bert, Pole Position, Popeye, War Room and Masters of The Universe. ON CONDITION: Some light creases around covers, mostly around edges of staples. Visit http://otakuboy.com
$8.00

[000048] Various. ANALOG COMPUTING - DECEMBER 1984. Cherry Valley, Massachusetts, USA: Analog 400/800 Corporation, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. 1984 was high-life for Atari Computers. Think about it. The XL series were riding strong and all those nifty new XE systems were just about ready to debut with their 6502c and FREDDY chips. You Atari fans know what I'm talking about. ANALOG was the BIBLE of that Atari fandom. And this issue is no exception. This one's a Christmas issue, with all kinds of ideas of what to stuff in stockings. Big article on Atari-style FORTH in here, too, along with a weather utility program and a game. BONUS piece is the big center spread ad for the OKIMATE 10, the first really low-cost color printer for home computers. Can you say, "Thermal Transfer"? I knew you could. ON CONDITION: The cover is a bit loose from the staples; you can't so much see it as you can feel it. There is an overall warp to the magazine and some creases along the spine. Visit http://otakuboy.com
$8.00

[000049] Various. ANTIC - DECEMBER 1985. San Francisco, California, USA: Antic Publishing, 1985. First Edition. 4to - over 9" - 12" tall. Saddle Stitched.

Magazine. Very Good / No Jacket. CES Buzz. That highlights this issue of ANTIC that hit the stands right before CES'85. What would Tramiel do? Perhaps an enhanced 800XL for 1985? Maybe a whole new direction for Atari computers. This issue has an interview with Jack Tramiel, then-chairman of Atari. Look over the predictions. How many came true? Sample question: "Are you actually saying that within three years Atari is going to market a small, user-friendly computers with the power of a VAX?" Of course, we know the history. But this interview defines it more clearly. Also, ANTIC's ever-popular Software Library. ON CONDITION: Very light bumping on outer corners. The binding is tight and seems a bit warped as this issue inserts a thick card into the binding. Also, some color fade on covers and slight browning on some interior pages. Visit http://otakuboy.com
$8.00

[000053] Various. ANALOG COMPUTING - FEBRUARY 1985. Cherry Valley, Massachusetts, USA: Analog 400/800 Corporation, 1984. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. ANALOG Mag was one of those Atari Magazines that rolled on during 1985. And why not? The new Ataris were out and it looked like a new set of 16-bit machines based on Motorolas powerhouse 68000 were set to debut at January CES. Wow. Analog kept us all in suspense and in tune! In tune how? Well, how about this issue with all the programming exercise and examples, including the ever-popular Ask Mr. Forth. Not to mention the really cool adventure game -- programmed and ready for you to type in BASIC -- based on a writer's adventures at Vandenberg. ON CONDITION: Very slight bumping and wear on the outer corners. Otherwise, a very clean copy with vibrant color. Visit http://otakuboy.com
$8.25

[000057] Various. ENTER - JANUARY/FEBRUARY 1985. New York, New York, USA: Children's Television Workshop, 1985. First Edition. 4to - over 9" - 12" tall. Saddle Stitched. Magazine. Very Good / No Jacket. For a short, short time, the Children's Television Workshop even got a bit of techno-buzz in the mid 1980s. ENTER was a magazine geared toward educating kids about the wonders computers. But what could have been a large, preachy magazine about how computers are changing classrooms, is really a neat sensa-wonder publication about super cool things to do with your computers. This ish? 1984-In-Review! The year's "Greats & Glitches". Also, a neat piece on which companies are producing the dreaded "Q*Bert Clones". Plus, a big feature on what laserdisc players are going to do to arcades. Remember Dragon's Lair? ON CONDITION: Shelf-wear along the spine on both covers and along top of front cover. Slight bump on lower right cover. Visit http://otakuboy.com
$8.00

[000074] Atari, Incorporated. ATARI PORTFOLIO QUICK REFERENCE CARD. Sunnyvale, California, Usa: Atari Coporation, 1989. First Edition. 12mo - over 6" - 7" tall. Very Good / No Jacket. Unpaginated - FOLD OUT - Atari was certainly dynamic, wasn't it. After first creating one of the most successful home videogame systems ever -- not to mention their wildly popular computers -- they go on to create a really sturdy PDA-before-there-were-PDAs. The Portfolio was a nifty little handheld that ran a very sturdy and clean version of DOS,

all in memory, for a pretty decent price. People gobbled them up. It's sad that Atari was eventually gobbled up -- and with it any hopes of a newer/bigger/faster Portfolio. But now they're appearing at thrift stores and antique houses. And, blazes, many of them still work. Fortunately, this Atari Portfolio Quick Reference Card will get you up and running in no time. It covers all the apps -- the calculator, address book, diary/calendar, text editor and worksheet -- not to mention the Mini-Lotus-1-2-3 and all of its functions. ON CONDITION: One slight crease in the middle of the first fan-fold. Also a small bump on one upper, front cover. Visit http://otakuboy.com
$9.00

[000083] Various. COMPUTE!. Greensboro, North Carolina, USA: COMPUTE Publications, Incorporated, 1985. First Edition. 4to - over 9" - 12" tall. Soft Cover. Magazine. Very Good / No Jacket. The big mag that wrapped up all the computing news from the mid-80s? (I mean, of course, aside from those stuffy magazines like InfoWorld.) COMPUTE! It covered everything 8-bit: Atari, Apple, Commodore. This issue contains -- ahem -- "TURBOTAPE: SAVE AND LOAD CASSETTE AT DISK SPEEDS" for the Commodore 64 and Vic-20. Other features: a lamentation over 1984's CES (how sucky it was), "1984 revisited" visits the hi- and lo-lights, plus a bunch of classic game ads, include Bally/Midway's foray into home gaming, and a _really bad_ ad for Summer Games from EPYX. Also: Enhanced Applesoft input. ON CONDITION: Very nice. Slight foxing on the upper left front cover. Otherwise, clean with good color and crisp conditions. Visit http://otakuboy.com
$10.00

I came up with a goofy idea. Hook the Commodore 1541 drive to the joystick port. Treat it like a parallel drive like the way you can hook the Commodore drive to the PC parallel port.

Silly isn't it?

1008. Where to find 800XLDJ

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-11 15:19:49 UTC
From: firest@williams-net.com
Message-ID: <t8dbcl4n1t5ecb@corp.supernews.com>
Source record: 38832

Anyone,
Where can I find the software for the 800XLDJ???????? Someone told me that I could use this software on my st and be able to connect my 130XE with the much safer SIO2PC. If anyone could give me a web site to go to I would greatly appreciate it!!!!! You can e-mail me at firest@williams-net.com or post it here on this newsgroup.

Thanks,
Carey

Kinda the idea, maybe move stuff from Atari to Commodore. Or if you don't want the SIO 2 PC can use the commodore drive. Hardest thing would be to do a simple driver.
Idea #2. Build the Commodore Parallel cable to the VIA chip, then tie it into the Atari PBI. Ok, that is way overboard.

>
>Silly isn't it?

Erm ... probably. Commodore 64s didn't use disk-based DOS; instead,
DOS was built into the 1541 disk drives on a chip. Therefore,
everything that went into driving the floppy was in the floppy itself.
I doubt it'd work for any other system, even if you rewired the
connection.

1019. MyDOS Ramdisk.com available Myrd and Myrd2

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-12 09:32:46 UTC
From: melee5@my-deja.com
Message-ID: <968ajvkim1@nnrp1.deja.com>
Source record: 38841

Hi all. I rewrote RAMBOOT3 into what I think is a pretty good AUTORUN.SYS file for setting up ramdisks on MyDOS machines. To give it a try yourself, just email me with the subject line of MyDOS and I'll attach a zipped, arced collection of both Myrd and Myrd2 with commented Mac/65 source and a readme to guide you in their use.

I found and corrected several bugs in RAMBOOT3 (some dangerous) and it now is something I can even use. Myrd2 is everything Myrd is, but includes the auto detect/configuration code from DUP.SYS to set up every machine at boot and then use it. Both programs detect a previous ramdisk and will not re-format a valid ramdisk. Plus other "goodies". Webmasters please host these files! Thanks.

Oh, that remainds me of an idea I had some years ago, but never really
followd:

Use a SPEEDY1050 to emulate this DOS inside the 1541 and the read C64
disks with da real thing.

Anybody got that idea too?
Maybe the 8K of the SPEEDY would not be enough...

of course you can!!!!

I can't remember exactly how, but try the PADDLE(x) in BASIC.

I don't know which x of {0, 1, 2, 3}!!!

The instrction returns some value, but when the button is pressed it
returns 10 or 9 or something.

So you just have to check for that

Hey there, Im trying to get some cash together before I go on a trip, so I am looking to dump some Atari things.

I have An Atari 800 with 48k in working condition. Im willing to take $35 US funds plus shipping. Let me know in email if you are interested.

I also have some Adaptec 4000a MFM->SCSI controller boards left....only a few of them, so if you want one get one soon. I am almost out. I am willing to sell those $30 US with shipping included in North America.

I also have some Atari 1050 disk drives for sale which I am also willing to sell for $30 US shipped in North America, or $20 Plus shipping elsewhere.

I would be willing to sell my Atari 800XL with 256k and Sweet 16......$100 US plus shipping.

I assume since you are talking real 1050 you either have a real 8 bit or are
getting one<vs emulator of course>.

Pretty standard practice is to just have the real 1050 plugged into your 8
bit and the sio2pc cable plugged into your 1050. Doesn't matter which you
set as D1: and D2: sio2pc and the 1050 should coexist together and you can
use the DOS duplicate disk function from there.

I'm not real strong on bank-switching. But I don't think you can
access more than a single 16k bank at once. The extra 64k can't
be seen as a single block, which seems to be what you're saying.
Well, hope someone has the Compute article you're looking for.
There are articles on bank-switching in Antic, which is indexed
on the web and easier to find than Compute articles, especially just
a reader's letter.
No help. Just commenting.

(I'm blabby this evening).
It might be worth summarizing the discussion Ron H. mentions.
Lance Ringquist of Video 61 owns and sells SpDos 3.3. He
doesn't want anyone passing 3.3 around (a, b, c, d?). SpDOSX
only comes as a cart, so you'd have to buy that one, which is not
available from any vendors I know of, you'd have to get it used.
SpDOS 3.2d was never shareware, but had some nasty bug, mostly
the trash the directory structure if a program left a channel open.
SpDOS 3.2f and g were shareware, from FTe and are freely distributable,
and it would be hard to find the owner to pay him his shareware fee of $20,
which you'd also get the manual for registering.
The discussion was about 3.3, which Lance sells on a cart. A cart you
have to pull out of the computer after booting if I'm not mistaken (probably
are some mistakes here, so go easy when you correct me.)
Oh, and Bob Klass also is part owner of 3.3, I think, or both Lance
and Bob own 3.3. Sorry for the confusion.

Why would you want to do that?? It could be possible I think if you used an
Atari ST or else a PC along with Xformer and the repsective Xformer Cable.
The Xformer cable allows one to connect an 8-bit drive to a ST or a PC. I
have saved files from a ST to the 8-bit drive using this cable. I guess
putting an ATR file on a 8-bit disk could be done.

When running the SIO2PC or APE software, it is just a matter of copying from one to the other. The DOS "J" Duplicate Disk is usually sufficient; often it can require a sector copier or MyDOS where you can force all of the sectors with the "(1-720)" option.

Hello.

Compute! once published a little article and program in its readers' letters section that told you how to directly access the extra 128k, and I'm not talking about the 16k bank swithching technique. Apparently, their program let you access a block of any size through a small machine-languare routine. Does anyone still have this article, and can they uploaded it to me. If you have a scanner, that would be the best method. Thanks!

Please email me at grimlock007@hotmail.com

If you reply to my yahoo address above, then remember to remove NOSPAM.

>I doubt it'd work for any other system, even if you rewired the
>connection.

Hi...

I had to jump in here for a moment (I lurk here everyday)..

Actually... the fact that the 1541 (1571 1581, too) uses it's own 6502, ROM and RAM makes it easier to connect to any other system. The only coding needed is to send the commands and read the serial data. I used to do a lot of copy protection removal from 1541 disks and got a little familiar with the system, although this idea is a bit out of my league.

If anyone is interested... take a look at this website...

http://www.fairlight.to/tools/pc.html (look at "disk readers, porting, and network/servers")

... there are tons of cable-type serial interfacing systems kicking around for MSDOS<>1541 and some of the packages include the source code for the software. Maybe someone could port the software to Atari, hack a little hardware and get this idea to work. I know I'd use it... it'd be a round-about way to get stuff from a PC to an Atari. (think about it... download to a 1541 connected to your PC... then put same disk into a 1541 connected to your ATARI !!! hehehe... a 1541 as the "middleman" !!! I LOVE the idea !!! Of course... I have 7- 1541s 2-1571s and 2-1581s)

I use both Commodore and Atari computers along with my PCs and I have to admit... the Commodore guys are way out ahead in the "hardware/software upgrade" game. And don't forget... the JPEG viewer thing was actually written by a Commodore guy but hey, I don't want to take away anything from the person that did the Atari port, I applaud the undertaking, he obviously watchs what has been happening with the Commodores... I actually wish more of this went on so I could enjoy my Atari on the same level. I enjoy the flexible graphics capabilities of the Atari more... I just have no way of getting stuff TO my

Atati.

Come visit COMP.SYS.CBM and ask about the SUPERCPU (20mHZ add-on cpu), IDE64 (yep.. an IDE controller), SWIFTLINK/TURBO232 (fast serial cartridge), and someone has done a VGA hardware hack for a new C64 video output. We've had people connect webcams, bubblejet printers, additional ram, etc.. to C64's and there is a new web-browser called WAVE for the GEOS OS (which has been upgraded and called WHEELS).

(sigh... I can see it now... my C64 website is gonna become an C64/Atari website !!!)

Question ??? Why would the joystick port be used to do this, rather then the serial port ??? Anyone ??

(sorry if this post was rather long)

later...

Well with a bit of display list wrangling you could get quite
impressive graphics out of the Atari if you tried. And it was a heck of
a lot easier than doing raster interrupts on teh C-64!

1045. Re: Gunship for the 8-bit

Newsgroup: comp.sys.atari.8bit

From: Kathleen Ferrante <KMFerrante@cfl.rr.com>
Message-ID: <zo4i6.144536$8V6.20690954@typhoon.tampabay.rr.com>
Source record: 38768

I worked for a Large Atari Dealer in the 80's here's the deal with Gunship
for the 8bit.
We got gunship for the C64 and we ordered the ST version, had them both is
stock for mail order. We bought so much stuff from EA and talked with Trip
at lease once a week, I had many Orders fro Gunship for the 8bit Atari in
back order that when Trip Called I asked him where's my order for Gunship he
then told me that it would not release it due to that Atari market being
85% Atari 800 with 48k, that a prototype 48k version had many drawbacks, and
to give a refund to orders allready paid.
I was unhappy with this cause my home computer was an XL, I did tell Trip
that 75% of our sale's where the 8bit Atari over both the C64 and ST.
He did come threw later with Mailorder Monsters, Racing Destruction set and
a few other.. oh Tomahawk was released by EA .
If anyone has the prototype or alpha please send me a copy..

Thanks..

>downloaded it. The best thing is you can alter the color pallete, so
>finally I can play Star Raiders with the proper blue shields and stars
>instead of that awful green (uh oh, here we go again!).

I've actually never played it, either on a real Atari or emulated,
where the shields were green. It's always been blue to me... but
we've done that one to death. :-)

>I am constantly amazed with the excellence of these emulators.
>Imagine that my PIII is also an Atari VCS, Apple II, Atari 800, Atari
>ST and Amiga. It's like having the best of everything all in one box.
>My endless thanks to all who work on these.

Great, innit? I've always thought that was cool. My PC also has
about 40 other computers, 30 other consoles and thousands of arcade
units inside it. Not to mention virtual game-and-watch and other
pocket game simulators. :-) Definitely saves on desktop space... and
electricity. And I never have to fight with dodgy 5.25" floppies like
I was forever doing with the real 8-bit. :-)

You could patronize Tomasz' homepage at www.a800win.atari-area.prv.pl
and grab it from there. He's really done a spot on job with it, right
down to the emulation of 1050 load noises! (Turn the SIO patch off
for regular load speed) :-) (I think he only simulates the noise,
though. I remember Spy vs. Spy actually changed the way the noise
sounded during loading on a real A8, but under A800Win Plus the noise
just turns off)

Hmm. This would require driver software to be written for the A8 in
order to be able to use it. (Along with a 15x1->SIO cable mod)

>If anyone is interested... take a look at this website...
>
>http://www.fairlight.to/tools/pc.html (look at "disk readers, porting, and

>1541 as the "middleman" !!! I LOVE the idea !!! Of course... I have 7- 1541s
>2-1571s and 2-1581s)

I dunno; the 15x1 drives, even up to the 1581, were all quite slow.
(2400BPS stock, 4800 with fastload; I think the 1581 got up to 7200 or
something like that. Compare with the stock speed of 19.2kbps of a
1050, 38.4k of an XF551, or 57.6k of a doubled 1050) I'd rather use
the C= drive as the last step in transport so as to minimize the
amount of time required to transfer data from one place to the other.

>I use both Commodore and Atari computers along with my PCs and I have to

Intersting. I've played around with GEOS under emulators, and have to
admit it's quite nice. It certainly got turned into something that I
wish Diamond GOS was made into on the A8. Unfortunately Diamond never
really took off, which is a pity; the cheapness and ready availability
of Atari mice (and the fact that they were interchangable between the
A8 and Atari ST/TT/Falcon line) should have made a GUI a natural
progression in the Atari OS department.

I guess we all loved our SpartaDOS too much. Well, I did, anyway.
:-)

>(sigh... I can see it now... my C64 website is gonna become an C64/Atari

Hey, can't we all just get along? :-) I remember C= and Atari users
fighting tooth and nail way back in the hey day. Now I can look back
at those days with an impartial perspective and realize that, hey,
both machines were pretty cool. I just still happen to prefer the
Atari. :-)

>Question ??? Why would the joystick port be used to do this, rather then the

I'm even successfully using two 3.5" mechs and a 5.25" mech from an
XF551 with my FloppyBoard.

> The BB "recognizes" a drive is there but I can't format, read, or
> write to the drive. I have tried 3 drives to no avail. I put the

> disks, black disks, grey ones, etc.

> Oh yeah, I did check the disks. They were not write protected.

If the BB recognises the drive, the cable should be OK. Did you set DIP
switch number 2 on the BlackBox to OFF? Are there 5.25" drives on the
same cable? If yes, before or after the 3.5" drive? Have you checked
out the 'Floppy Board Drive Parameters'? Are you sure each floppy drive
has a different ID (the settings on the drive)?

Do both connectors (between FB and BB) make good contact? I believe CSS
sends everybody these zip-tie's or whatever they are called to keep both
fermly together. (I replaced the previously unused connector with one
that has longer pins, put an extra precision socket in the socket where
a chip used to be and am using nylon screws und bushings to keep the FB
and BB at the perfect distance.)

You say you have tried three drives? Are they all the same brand or a
mix? I'm using TEAC's and they work fine.

You're not trying to use 720kB drives on 1.44 MB disk, are you? Maybe
it's on the drive, but if it isn't, 1.44 MB drives have a small switch
just behind the door. If you push the door open using a pen or a ruler,
you should see a pin on the lower right side just behind the door.

Dip switch 2 is off. There is only one drive, the 3.5". I tried all the
jumper settings on the drives with all 4 of the drive id's in the floppy
board drive parameters.

> Do both connectors (between FB and BB) make good contact? I believe CSS

CSS installed the FB for me, so it came with the zip-ties.

They are three different drives, a Panasonic, an Epson, and a Sony.

No, all three are 1.44mb drives.

Thanks
David

Right... should be possible, no ??

>>If anyone is interested... take a look at this website...
>>
>>http://www.fairlight.to/tools/pc.html

I thought maybe the C64 tools at FAIRLIGHT might "inspire" sombody !!

>I dunno; the 15x1 drives, even up to the 1581, were all quite slow.

Ok.. they were slow... but this shouldn't be a deterent if anyone wants to take
a try at this.
Actually... their are some quite fast cartridge based loaders for the C64... my
Datel Action Replay is about the fastest. and there is JiffyDOS rom chip
replacement. I have a "dump" of the AR cartridge so it could be "reverse
engineered"... but now we're probably getting to complicated.

>the C= drive as the last step in transport so as to minimize the
>amount of time required to transfer data from one place to the other.

I think speed is a matter of semantics... as long as it worked I'd be happy, me
being both a C64 and Atari user.

>>there is a new web-browser called WAVE for the GEOS OS (which has been
>upgraded and called WHEELS).
>
>Intersting. I've played around with GEOS under emulators, and have to
>admit it's quite nice.

GEOS (WHEELS) with a SuperCPU, a Creative Micro Design hard-drive (or IDE64),
JiffyDOS dos extender/fastloader and expanded ram would be the ultimate C=
setup.

>>(sigh... I can see it now... my C64 website is gonna become an C64/Atari
>>website !!!)
>
>Hey, can't we all just get along? :-) I remember C= and Atari users
>fighting tooth and nail way back in the hey day.

I've always had both, so I stayed neutral !!! :) When you start programming them both in assembler... you find they aren't very different. (but display lists on the ATARI 8bits are WAY easier to understand than raster interrupts on the C64 8bits !!!)

I will always remember my C64/Atari days as the fondest of memories !!! Cracking copy-protection, writing trainers, swapping disks, calling the BBSs, "the scene"... today's users have no idea what is was like !!! Kinda makes ya yearn for 1986 !!!! :)

>>Question ??? Why would the joystick port be used to do this, rather then the
>>serial port ??? Anyone ??
>
>Why not the SIO port? It's faster than both.

Sorry... my mistake... that is what I meant to imply.

I'd really be impressed if this idea got launched. I'd be willing to do anything I could to make it easier but my coding in 6502 is as rusty as it can get and not just fade away altogether. I never really got into the issues of timing the read pulses needed for such an undertaking. I see no reason it can't be done... there is a cable and software to read cross-platform drives on both the Atari and the C64... so there are programmers who understand this stuff...

Anyone willing to give it a shot ?? maybe I'll go over to the C64 group and beg over there too !!!

later...

Okay, time for my stupid question of the week. I've got a Migraph handheld scanner, I think 400dpi with it's software 'touch up'. I was wondering since this uses the cart slot on an ST could it be adapted with little or no difficulty to an 800XL? The slots are different but maybe the pinouts not so? I know the software won't work, though. Mo

If its like mine there is a folded membrane under the keys.

Open it up, unfold the membrane then fold it again along the crease. Then re-assemble

It certainly worked when my one started playing up key wise. I think its just an age thing. You may want to think about geting replacement parts from one of those USA shops that do them.

> had
> everywhere.

That's actually much less likely to happen than a USB SIO interface --
it's much more difficult to get the Atari 8-bit to be a USB host than a
USB device, because USB depends far too much on the host being a 32-bit
computer with a much larger address space than 64KB.

To get down to specifics, all standard USB host controller ICs are PCI
devices. Thus the direct approach would amount to interfacing the Atari
8-bit to PCI, which is not a simple proposition as PCI is a 32-bit bus
with a 32-bit address space. The indirect approach is to roll custom
USB controller logic (probably in a FPGA) and line driver circuits, but
this would be a lot of work.

Getting USB drivers working on an Atari would also be a problem.

USB to SIO peripherals are quite straightforward to do. It's also
possible to do a high speed interface to that parallel bus on the back
of 800XLs which I forget the name of.

For example, Cypress Semiconductor sells a line of flexible USB
peripheral chips called "EZUSB" which consist of a microcontroller (8051
or some kind of custom lightweight RISC in some of the lowend chips),

USB circuitry, and USB communication code. The chip typically has general purpose I/O lines, a serial port or two, and so forth (how much I/O depends on which variant you get). One of the 8051 EZUSB chips would be perfect for SIO; you just write 8051 code to make the chip into a SIO to USB interface device, connect the SIO bus to the EZUSB's serial port, and away you go.

That would be Best Electronics at www.best-electronics-ca.com.
There are two kinds of keyboard mylars (the plastic sheet). The one layer and the two layer. Make sure you order the right one if you do (the cost 22 US dollars each. OUCH!) but they do work fine. The single layer mylar Best sells is especially made for Best. On the double layer mylar, there is a thin layer of plastic between the folded mylar. DO THROW THAT ONE AWAY!!! You'll need it with the new mylar.

CU Mathy van Nisselroy

PS if you can efford it, get their Catalog too. It's practically an Atari Encyclopidia.

I blabbed on but didin't give you a link.
ftp.spudster.org under utilities/DOS//SpartaDOS, you can find
FTE32G.ARC. I'm not sure it is a boot image, tho, which you'd need
to make a SpartaDOS disk that would boot. I guess it is a DCM
or SCOPY file, don't remember. .... I just checked, it is a SCOPY
(.scp) file, which leaves you up the creek, because you don't have
a SpartaDOS boot disk to run SCOPY from. Well, it's there, but
I'm not sure how you can make a boot disk out of it.

How is 'Allow ROM patches' in the 'Atari Settings' set? If it's on, it's
normal that Memory Test shows ROMs red.
It seems you have a bad or not-booting image. Or the software you try to run
detects you'd chosen wrong settings and goes to Self Test. Or you have a
cartridge installed. Or you have bad ROM dumps (but in that case you should
receive a warning when setting these ROMs up).
BTW. David Firth is the author of Atari800, not the Atari800Win.

Bye,
Piotr

Might have answered my own question SORTA. here is what I did

loaded ATLANTIS.COM 8332 bytes into Atari800Win.exe
started the monitor
then wrote memory address $A000-$BFFF to a file (output size 8192)
renamed to test.rom
restarted Atari800Win.exe and set test.rom as a cartridge and it loaded

will this image work for a eprom cartridge

But I did the same thing with pacman and it crash the emulator

So *that's* what the Kitchen Sink was.

Everyone probably already knows this, but the wedge of cheese you pick
up is actually a ship you can board -- and it goes like a bat out of
hell. I think it's the only one you can use to reach the space
station by flying, too. Best of all you can land, leave the ship,
then pick it up and carry it with you.

When you create a loader then you can simply copy the data to right locations as soon as the computer is turned on and the cartridge starts. After the software is copied from the cartridge to RAM you can jump to the code start address and run it.
You can also make a switch on the cartridge to turn the cartridge off when the software is loaded. Done it for a friend of mine on his SpartaDOS 3.3c cart...

>replacement. I have a "dump" of the AR cartridge so it could be "reverse
>engineered"... but now we're probably getting to complicated.

Well, even so, that's getting a little high-end for initial test
purposes. Maybe if the project moves along and actually shows
progress it might be something to consider for those who want to give
it a try. I still think it might be of limited interest, though.

>GEOS (WHEELS) with a SuperCPU, a Creative Micro Design hard-drive (or IDE64),
>JiffyDOS dos extender/fastloader and expanded ram would be the ultimate C=
>setup.

Sounds like it would be. Like I said, GEOS/Wheels is what I'd have
liked to have seen on the A8. I actually think it would have been fun
to program under.

>I've always had both, so I stayed neutral !!! :) When you start programming
>them both in assembler... you find they aren't very different. (but display
>lists on the ATARI 8bits are WAY easier to understand than raster interrupts on
>the C64 8bits !!!)

Hehe... yeah, display lists were dead easy, and lots of fun to play
around with. They also made it REALLY easy to achieve some really
great effects, even from BASIC. I even remember the code; I used to
play around with that a lot from regular and Turbo Basic. My first
game on the A8 used display lists and redefined character sets, which
at the time was a great achievement for me. :-) Still, back in the
day there were always minor wars and stuff between C= and A8 users...
looking back I sort of enjoyed them, 'cos those who were knowledgable
enough about their respective systems could pose good technical
arguments. Those I liked participating in. :-)

>I will always remember my C64/Atari days as the fondest of memories !!!
>Cracking copy-protection, writing trainers, swapping disks, calling the BBSs,
>"the scene"... today's users have no idea what is was like !!! Kinda makes ya

>yearn for 1986 !!!! :)

I was never into the hacking scene. My programming projects were
mostly fun stuff... a few games, plus a bunch of modules for Oasis BBS
when it was still around. I remember I used to beta test for Oasis,
and until Glenda got round to mapping out all the internal BBS
variables, I had to sit there in SpartaDOS searching for jump points
to jump to when my module exited. That was always fun... yeah, in a
lot of ways I do wish it was still the good ol' days. Back then
everything was still pretty new and everything was always fun and
enjoyable.

>I'd really be impressed if this idea got launched. I'd be willing to do

>be done... there is a cable and software to read cross-platform drives on both
>the Atari and the C64... so there are programmers who understand this stuff...

I haven't done 6502 assembler in many, many years. I can hardly even
remember any of it. I do remember that once I started learning it
though I realized how easy it was, and actually had fun programming
stuff in it. Of course, the only really notable release, other than
my Oasis BBS modules, was Fortress on the A8. On the record I never
got credit for helping to write it 'cos I left the A8 scene before the
project was done. Jeff (Zark Wizard) didn't like that one bit, so
took all references to my name out of the program. Nice gratitude...
oh well. I still take some consolation in the fact that I can really
see where my code left off and his code began, 'cos he's definitely no
graphic artist. :-)

Still digging in the past... I guess picking up the Large Box let you carry more than 10 items. I m not so sure on that one, I admit!

Anyway: THAT GAME BRINGS BACK A LOT OG MEMORIES.

It s still my favourite game on any computer. I just wish, they d completed the Damocles PC version in 1995/6.

Any thoughts on what Paul Woakes is up to these days?

Frank

Well, yesterday night I took apart my keyboard and put it back together with one (instead of a dozen or so) screw, so I could test it out. The keys that weren't working made contact, because the power light was dim (because I didn't put all the screws in) but when I typed the broken keys, the light turned bright. They didn't register to the Atari though, maybe it's a chip like the Pokey or something. Does this mean much?

Might go home and see if I can get it going on my Falcon/CT2 or Mega STE:-).
I first played this in the 1980's on my 800XL. I used to love knocking over
the commodore sign's, too.

It means your pressure on the keyboard was improving the contact for the
power LED ;)

Richard

hmm... I recently was working on Tom Hunt's ATASCII emulator terminal program for telnetting to Atari BBS's on the net. One of the things I added to it was a "screen print" function.

It occurs to me that with a little code added to his functional idea, one could have a PC program that could read and print ATASCII files - carrying that idea a few steps furthur, the thing might actually function as an ATASCII word processor for the PC.

I realize that's not exactly what you're looking for, but I was brainstorming a bit when I read your message.

I seem to recall being able to do just this using the Antic G: device ... its
been a while, and I do recall that my laser printer at the time did have an
Epson mode ...

Then again I could be completely wrong :)

Ok, I tried that solution with the membrane, but it didn't work. The keys still don't register. I unhooked the keyboard from the main pcb and the connector was pretty dark and burnt-ish, maybe that's the problem? I used my screwdriver to try to rub off the burn, but it didn't seem to do anything when I tested it out.

If you know something about Atari internals and 6502 assembler, you
should know why it crashed. If you don't know, sit down and learn
something, indead of doing such hocus-pocus.

All the files you name above are ripped cartridges. Converting ripped
cartridges to 'rom files' is basically a bad idea, because lots of the
images were tampered with. Because they have checks if they are in rom
or in ram (dumps), they had to be changed. Sometimes it'sjust one
instruction change (someting -> NOP for example), sometimes there must
be more instructions. In such case small assembly routine is put before
actual cartridge space and jump or jsr instruction is put into the
cartridge code. If you then save memory region of cartridge, you are
stripping the additional subroutines and jsr routine will jump into
nowhere. This proves my point -> go and buy cartridges. There are lots
of them on Ebay.

BTW: For the others. I started the 'Atari Cartridge Dumping Project'.
It's purpose is to make dumps of all the cartridges every produced for

that system (Hi, Lance!). I'm looking for technically educated people/or
cartridge collectors which wish to help in such task. Do not ask for
files now. Every such mail will be immediatelly deleted.

> good...

There is at least one (small) bug in the floppy emulation (get status SIO cmd), but I do not know, if there is any program caring about that. Because of the major changes in V 2.16 I could not figure out yet, if the timing bug in the printing routines (found and described by Erhard Puetz in ABBUC mag) is still there ...

Hope to get the time for reassembling the documentation for my BB-modifications soon - sorry ...

Bye,

Matt

I already had connected an internal 1571 of a C=128D to the joyport 6-7
seven years ago.
I also had some basic communication, [but was not able to read a file or
something like that].
But nowadays the code is lost and the C=128D is sold again :-).

So it is possible and IMHO an 1571 will give some nice additional
features ...

The best thing with this game was, that it built some bridges between
the C= 64 and the Atari fraction of our class in school.
We were looking for solutions, secrets and hints together ...
I cant remember, if there was any other game doing that !!!

Bye,
Matt

I've been thinking some more about this, and now believe that a viable solution is to make up a complete Windows (bitmap) font of the the whole Atari set. Unfortunately, I don't know how to do that right now, but there must be some development tools available for creating new fonts. I plan to check this out. In the meantime, I'll look at Tom's Atascii emulator.

>It seems to be a VERY nice project. 24 bit graphics. Drool, drool, drool.

I was following the progress for awhile but either I missed the recent postings or the wasn't much followup after the annoucement to take the hardware prototype to the SWRAP expo fallout.

This was posted some time ago...

==========
Here's the latest update from JERI ELLSWORTH!

9/29/2000: I have just compiled the VIC compatible revision of the chip and it mostly works. The biggest problems are with the sprites (things like latches stay on after reading the collision register ... etc), but I don't see any huge problems fixing them. I hope to have prototypes out to the programmers in 4 weeks or so.
==========

and I do have some tech info on the hardware, if you want to see the details, I can either post it here or send it to you in email. It's a rather lengthy post and I don't want to clutter up the A8 group with C64 tech data without there being some expressed interest.

But, if your asking what became of the project since the expo showing... I haven't a clue.

later...

Hey all, I got a hold of this Migraph handheld scanner 400dpi for the atari ST. The cartridge interface won't fit in an 800XL but would an adapter be possible? I didn't even know that ST's used cartridges, I've never had one. Thanks! Mo

Well,
LK avalon is still alive and they still sell games from LK Avalon and licensed games from ASF and others. The URL is www.lk-avalon.com (or something like that, you know, I use bookmarks!), just write them an email and you will get a list of their Atari items (plus PC items, if you like). For me, I am german, they sold me the games for 5 german marks or 3 US-Dollars per game. Maybe for czech and other eastern european users, they will accept other prices and currencies...
Besides, they have some 50-100 games from the 90`s. But I am still looking for someone selling original Mirage, Sikor soft, Domain Soft and other polish and czech A8 software (only originals!) -Andreas

Well,
Amaurote is not a polish game (published by Mastertronic a british vendor!), without infinite lives too difficult for me to play... And Barahir looks graphically really nice, but I have that language problem too...
If anyone is interested, I could mail a list of polish games plus short descriptions. As I have already said, some games are still avaiable from LK Avalon (www.lk-avalon.com)... -Andreas

Well,
the Mercenary compendium includes Mercenary (escape from Targ) +plus+ second City in one package (as *one* disk or *two* cassettes collection). there also was the choice to get a bigger collection, which included all official maps for Mercenary (and maybe Second City too). But therefore you had to send some dollars or pounds to the vendors/distributors... (not many people did do that). Finally, there were many maps to be found in several magazines, like Happy Computer Magazin (german), Happy computer Atari Sonderheft 1+2 (german), Happy Computer Spiele Sonderheft 1-4 (german), Page 6 (british), ZONG (german), etc. etc. Sorry, I am a german, thus I remember the german magazines much better... -Andreas

If ya really wanted it Mathy, you shouldnt have low balled. The R time 8 is sold, along with the Sweet 16 800xl, and most all of the Adaptec boards.

I have only a couple (2) Adaptecs left, and I sill have the floppy drives for sale. The Atari 800 might be sold soon.....the first person to state they are sending payment gets it.

I have lots of other cool things Im gonna be getting rid of soon. Stay tuned.

> that system (Hi, Lance!). I'm looking for technically educated people/or
> cartridge collectors which wish to help in such task. Do not ask for
> files now. Every such mail will be immediatelly deleted.
>

Do the current emulators (primarily Atari800Win) handle
the bank switching ROMS, or do we need to create a small
header (like ATRs over XFDs) to let the emulator now
how to treat the ROM data? Although this requires updating
Atari800Win a bit it would be worth specifying now.
Things to include (in say 64 or 128 bytes):

Type (Left/Right/OSS/XEGS/XES etc), Title, Publisher, (Release Date)
followed by the ROM data at offset 64 or 128.

Comments?
Dare I ask if there are there existing formats for other 8-bits we could
use?

Regards,

Mark

I was just about to say, I've run across an Atari font on the web, as well as a Commodore 64 font. I'm not sure if the ASCII values for the characters match the ATASCII values, so you may need to write a converter. It would be pretty simple. I've written something in the past to handle DOS->UNIX and vice versa text file conversions... in that case it's merely a matter of line feeds. In the atari case, it may need to be a little more complex, but nothing too difficult.

Anyways, use this link to get the font I mentioned:

>I dunno; the 15x1 drives, even up to the 1581, were all quite slow.<

The original code/protocol were slow, but there is nothing inherently slow about a C64 drive with a 6502 (not a 6507) running at 1 MHz -- same as a 1050 IIRC. Put in new code, and they run right in the same ballpark as Ultra Speed (the equivalent of apx. 1 DD track per second.) The 1541-II (external power supply) is a very nice unit. BTW, Creative Computing (pretty sure it was them) did a benchmark on the 810 drive and the 1541 and I think the Apple II drive, too. The 810 was actually the slowest of the lot in writing with write-with-verify mode. Of course, the Apple II ate everyone for lunch.

I ran across a Portfolio link that indicated there is a Portfolio adapter to use a Compact Flast card in place of the original memory card. Very cool! Then I remembered a post saying that a Compact Flash card can be used essentially as an IDE-compliant device. There is quite a bit of interfacing info at
www.sandisk.com
The prices on these memory devices are now getting very competitive. Has anyone else looked at this info? This appears to be of real potential value... An internal "Hard Drive" with ramdisk speed?

Hi!

Doesn't anybody know somebody who could have these Antics:
CO12296
CO21697

also CTIA is welcome.

I know Best have them, but together with postage it's simply too much
for me... (europeans preferred)

bye,

The code for the bankswitching for XEGS/SDX carts was submitted by me to
the developers of Atari800. There will be bankswitching type choice if
the file is 'plain rom'. But there is already 'CART' file defined, which
has 12(?) bytes header, which has the necessary info. Wait till next
release.

> If the DD images have 184336 bytes, they're invalid. DD images must be
> 183952 bytes long. Maybe that's the problem.
I've made some modifications to Atari800, so both 184336 and 183952 images should work with recent emulators. True, that some images stopped booting. These are DD images with 720*256 bytes, but having sectors 1-3 in first 384 bytes. I understand 128-byte boot sectors, 256-byte boot sectors with 128 bytes used in each, but using 1.5 sector area for storing data of 3 sectors is an absurd. I recommend using 183952-byte ATRs, they work fine with old and new emulators and APE (I'm not sure of SIO2PC). And they are shorter. :-)

Bye,
Piotr

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

Jindrich,

I have some of those, the 12296 and 21697. Can't locate any CO12295
CTIA's though. Didn't really hang on to those.

Let me know if you want them.

Well,
not true !! A friend of mine has Gunship for the A8 (or he will get it
in a few days). Unfortunately he merely is a collector, thus he will
surely do no copy or ATR image for us... -Andreas

P.S. I also now a few other german collectors who have the A8 version of
Gunship. But you know collectors: they never open any package or test a
game...

Well,
do you have an Atari ST ?? Then I could email you the XLDeejay. I could
also email you some .DJ images for test purposes (but the DJ works
similar to Diskcommunicator, it shrinks the data, thus images are
smaller than 90/130/180 kbytes). Unfortunately the author of XLDeejay is
long gone, there are no sources about the DJ avaiable yet. Could be a
little complicated to find out yourself how a DJ image works...

If someone could send me information 'bout the formats (ATR, XFD, XLD,
DJ) I am the one who can write a little converter.
But I have no time to do such things as figuring out the formats of those
files. Maybe some has done this already.

greeting,
daniel

I've never even heard of it. I agree, it's a myth. But, how would you judge
the existence based on advertisement. You know the Atari manufacturers, they
liked to keep secrets :)

I have put up my atari 8-bit collection on ebay. The auction (at about $25) includes-

atari 800- Fully functional 800, only foreseeable problem is the 1 key doesn't work. The winner can just pick up a number pad for about $5 or can bet bravo-sierra to replace it.

Atari 400- sold AS IS, because the power supply is out of commision.

Basic cart- working basic cart

manuals- all manuals in binder, includes some advertising brochures and catalogs too.

I could be persuaded to take paypal if the bid is over $50.

Actually someone has done something similar.

They took Play Station 2 boxes and auctioned them at ebay. In the buying
frenzy people didn't read the title or description completely and ended
up paying over $300 for a box.

There are more than one or two cases of this.

Atari800Win Plus is the way to go. As for Turbo Basic, I have an
original ARC packed away in my Closer to Home mirror. I could
probably manage a way to turn that into an image for you.

Okay, I've uncovered the two-disk DCM version, which I am about to
post on alt.binaries.atari.8bit. DCMs can be read natively just like
ATRs and XFDs by Atari800Win/Plus.

1171. How to tell which Atari Basic Revision that you have

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-17 06:32:31 UTC
From: w_a_lang <w_a_lang@willinet.net>
Message-ID: <t8s6nnioqfe8d4@corp.supernews.com>
Source record: 38644

The memory address that identifies which Basic that you have is 43234.

So when you start your Atari up, at the READY prompt, type in this command:
PRINT PEEK (43234)

You will get a value of 162 if it is Rev A Basic.

You will get a value of 96 if it is Rev B Basic.

You will get a value of 234 if it is Rev C Basic.

Amateur Atari historian and Devout Atari game player,

Bob Puff? He's a Atari 8-bit guru, developer, famous A8 person.
CSS, his company, makes the Black Box (hard drive interface).
He made many essential A8 programs. Arcer, unarcer, telecomm
software, and the disk communicator, which can be found at
ftp.spudster.org under CTH/utilities/utilities_files/MISC file
dskcom32.arc. If you don't know arc files. You can use pkxarc for
the pc or supunarc for the A8 (also at spudster
CTH/utilities/utilities_files/archivers/ARC/supunarc.com.
You can also find the dskcom32.arc under CTH/utilites/utilities_files/
diskcomm/dskcom32.arc.

If the seller used artful language without actually lying (ala Pres.
Clinton) to create the impression that he was selling a system and not
a box, then it is still fraud.

I bought a projector whose seller described it "the wheel spins, the
lamp lights" but omitted the further info that is was obviously bent
to heck, and it didn't spin correctly and it was broken. That was sort
of a gray area, but it still ticked me off.

Hello, Mindfield.

My server does not support alt.binaries.atari.8bit. It does support alt.binaries.atari, alt.binaries.atari.cancelbots, alt.binaries.atari.d, alt.binaries.atari.dead, and the last one alt.binaries.comp.atari8bit looks like it my be yours because it has two replies to spam mail. Could you upload it to this last site? alt.binaries.comp.atari8bit

ATari800win? I'll search the net and download it. What is the latest version? Also, a very important question - does atari800win support 64k (and maybe 128k) ? I know that TBXL requires 64k.

Thank you very much! I rmember using both TBXL and BXE when I was young, and I was always amazed at how good TBXL was. And when you add the compiler, it blew BXE out of the water!

Well Jim are you talking about modification of the actual
1050 disk drive to run at 1.44MB?

I don't know if that old a technology could handle it.

Wally

A DOS that supports 1.44MB are MyDOS and SpartaDOS. Both can handle up to 16
MB Diskspace (65536 Sectors, 256 Byte per Sector = 16 Megabyte).
I use my PC as an high-capacity-diskdrive. I have a 16 MB-Partition with
MyDOS and my graphical user interface (BOSS-X) for best overview.

ATARI 800 Win (Plus) supports up to 320kB (Compy / Rambo)
Turbo-BASIC works very well with it

Yes, the eBay community forums basically chewed the guy out that sold them
initially. I didn't agree with the chewing out as it was the fault of the
bidder for not reading the item description.

> There are more than one or two cases of this.

Similar things happen constantly on eBay.

Bob Wooley once said in an off hand comment that he thought he could modify a 1050 to use a 1.44MB drive. If Bob thought it, I've no doubt it could be done.

IMO: The popularity of SIO2PC/APE solved 8 bit storage problems so well, it took away any reason to do the hack. Since most of us seem to have either STs or PCs, it's even the solution to other features like 8 bit high speed net access or modems.

I'm hard pressed to think of any projects that are 'must do' now because that can't be solved by SIO2PC after a fashion. If someone says they would like a 16 meg RAM disk I have a tendancy to think "Just toss APE with a high speed emulated 16M disk at it". I don't feel bad about it, more like closure since we got virtually everything we need.

Agreed. I am just thinking of the Tramiel era of Atari that was so infamous
for its lack of advertising. I'm not sure how that compared to the 8-bit era
(as I don't remember the early part of it).

> I can't see some softy house paying great wads for advertising and not

Oh yes, think 1400XL and 1450XLD. But be thankful, the Atari XL ad booklet was
(and is) the only documentation those models for some users, as I am sure ads
are for so many other products.

>
>P.S. I also now a few other german collectors who have the A8 version of
>Gunship. But you know collectors: they never open any package or test a
>game...

well I can't believe it. If it's soo rare, why there is no copy, no
screenshot, no manual, no official statement on the a8 version
available? If ANYONE is safe to say, that there is a working version
of Atari-8-Gunship, it is a mystery.

In a box of mine (Silent Service) was an advertisment for Gunship.
Usually microprose created a table with all platforms (c64,st,amiga,a8
etc). In the cell gunship-a8 stands "soon" ....

Well at least with an advert there's a small chance that somehow the
game made it out in some state either from the front or the back door.

I can't see some softy house paying great wads for advertising and not
bringing the game out although it has happened many a time on all
formats :-)

Never ever seen Gunship either....Lots of mentions in the group but I
doubt anyone actually owns a copy.

I used to use Turbo Basic XL quite a lot. I wrote a game called
Nibbler in it (which is probably completely lost in the mists of
time), and even compiled it to run as an executable. I was very
impressed with it on the whole. :-) The cool thing is Frank
Ostrowski, author of TB, went on to write GFA Basic for the Atari ST,
which I programmed in exclusively. And GFA was just utterly
fantastic. A very natural progression from Turbo Basic, with TONS
more features and the ability to program at a pretty low level for a
BASIC language.

Sprites for sure, the character would be very bland unless they
multiplexed the sprites which would not leave a lot for the others on
the same lines.

Music would not be a problem

Date: 2001-02-18 02:37:52 UTC
From: rhamiiton5@aol.comedy.com
Message-ID: <20010217213752.04028.00000226@ng-cj1.aol.com>
Source record: 38665

The current status of the patches to DiskMend sector editor is here:

http://members.aol.com/rhamiiton5/diskmend.zip

This contains the original plus DM7.LST and a brief doc on the mods. It will be replaced with the final update when complete. It now supports multi-drives, subdirectory listings, MyDOS file traces, disassembly of boot or DOS sectors to a file or screen or printer and writes to a 2nd sector location in single, enhanced & double density.

-Ron

Inform everyone that communications have completely broken down.

1197. ebay: [was Re: Gunship for the 8-bit]

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-18 07:19:23 UTC
From: Bob Ryan <ryanr@one.net>
Message-ID: <3A8F777B.74CE6DB@one.net>
Source record: 38670

When the thing first came out, there was more demand than supply. A lot of people sold them on ebay to get a lot more than they paid. I recently saw one go for over $1,300.00 on ebay. And, my step-daughter paid over $600 for one because her husband "had to have one" for Christmas. I told her to wait five years and get it for $20 at a yard sale.

Some people got smart and realized that if they word their title and description correctly, they could get someone who didn't read close enough to think they are actually buying the game console when in fact they are only getting the box.

The one I remember had "PlayStation 2 box and receipt" as the title. Unfortunately, I cannot find that auction at ebay now.

Uhm, it's bragging rights. If you show your PSII box to your friends, they
might actually believe you have one locked away somewhere.

> I mean I have been throwing away my empty cereal and
> oatmeal boxes. Should I be selling them on eBay?

Maybe...if you save them for 10-15 years it's entirely possible that they would
sell. There are people that sell WonderBread wrappers, cereal boxes, shampoo
bottles...all vintage of course.

$1300 bucks? Dang. There are people already selling the new Microsoft console pre-relase and the prices are going up in the thousands of dollars as well. The console will retail much, much, lower than that. Microsoft has also promised that the console will have adequate supply as well...which means no need for pre-release sales.

> And, my step-daughter paid over
> $600 for one because her husband "had to have one" for Christmas.

And so did every kid on the block.

> I told
> her to wait five years and get it for $20 at a yard sale.

Hehe...and would you get the box with that? Nope. It'll sell for $1300 on eBay.

> Some people got smart and realized that if they word their title and
> description correctly, they could get someone who didn't read close

I think that anyone who is looking hard enough for any trace of PSII will buy anything...including just the box.

> The one I remember had "PlayStation 2 box and receipt" as the title.
> Unfortunately, I cannot find that auction at ebay now.

This is the guy that myself and several others over at the eBay "Soapbox" forum chewed out. I think eBay finally cancelled the auction.

OK, thanks. Sounds like it was an intentional scam to me too anyway.

Either outright or there was another level of scam going on. I've got an early 18" sat dish. Paid something like $50 for the dish/reciever by subscribing to Direct TV for a year. From what I have seen it could be worth up to $450 on the used market and if I want to pull out my activation card, I can sell it alone for $179. Something like someone has figured out how to reprogram them for free service so the old encryption cards that have the encryption broken are worth more then a brand new unit.

If it wasn't an outright scam, it was probably targetted at people that wanted to "launder" one that "fell off a truck" or something. Probably just as bad.

Source record: 38679

Right, but we were focusing on hacking a 1050 to use a 1.44 mech. My position is that SIO2PC/APE are a more logical and cost effective way to go. I don't know what Erhard was selling his for, but I would guess that he used the same floppy controller as the ST and Black Box. Last time I priced those things, they were something like $20/each and the only place I could find them was a chip surplus warehouse in England.

I'd imagine to break even on his boards, he would have to sell them for $50+. For $50 you can get an old laptop with built in hard drive and 1.44 meg floppy in the US. Just a much more cost effective solution to storage problems.

If someone could hack a 1050 to work with a 1.44 meg drive for maybe $3-$6 it might offer some competition to SIO2PC. I don't see that happening at this stage of 8 bit development.

Hi,

http://atari.pagetostart.nl/ is a Dutch-based but English written website on Atari. It's not my site, but I use it almost daily as it is a little portal to everything I need and want to know. Just to inform you, maybe you could use it.

Bye,

John

Hi Rick,

Yeah its true, the 1772's are extremely expensive, but you can get away with using a 1770, you just can't acheive a step rate of 6 or lower, but its not that critical on a 360K or 720K drive, it may be necessary on the 1.44's I've never looked into that so I'm uncertain. The 1050's use a 2793 which is 1770 compatible if I remember correctly.

You can get them from scrapped ST's/TT's?mega's and Falcon's. That is the easy way to get em. The problem with the chip is that it needs to be run at 16Mhz to access a 1.44. The step rate should be halved (from memory, I could be wrong). The Mega STE/TT/Falcon used the Ajax chip which was a replacement for the 1772. Incedently you can overclock a 1772 but only the 02-02 variety.

1213. SIO2PC for dummies?

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-19 03:46:42 UTC
From: HedgeSlammer <hedge@home.com>
Message-ID: <MPG.14fa539f3542a15598991c@news>
Source record: 38687

I am planning on building an SIO2PC device soon.
Wiring it up is not a problem but I find the documentation for SIO2PC
rather over my head.
Is there anywhere I can find a document which just tells me simply
how to use the SIO2PC instead of descriptions of "how it works"?
A simple list of commands would be most helpful. Or is the program self
explainatory when you start using it?
I can't figure out if I can just make a directory (or disk image)and put
a whole bunch of games into it and what the maximum size an image can
be.

TIA

I really need help with this one. Will my ATR8000 support 8 inch hard sectored floppy disks? My manual makes a vague reference to 5 1/4" hard sectored disks, but says nothing explicitly.

Any help would be really appreciated as I have data on these disks in a foreign file format and I am trying to reduce as many variables as possible.

Thanks,
Mark

I use the APE for DOS program, I can't remember the URL but I think if you search for APEDOS or APE98 or WINAPE you'll find the link. There is a crippled version for free download that has most of the capablities of the full version and its very simple to use. The program was written by Steven J. Tucker whom I've spotted frequenting this group. The DOS version works better on my old IBM486 than the WIN version and it's pretty well documented with a good help feature. You can also create ATR's through the program. I give this little app an A++ ! Thanks Steven! I'm gonna register it as soon as I get my allowance.

Hey all, I took a few minutes to clean up my home page a little bit. I've
also added a link for an ATR that contains the following games (in BASIC)
from Avalon Hill. I got a hold of a small box of tapes and did the transfers
myself.

Titles included:
Midway Campaign
North Atlantic Convoy Raider
Nukewar
Conflict 2500
Andromeda Conquest
B1-Nuclear Bomber

and maybe more I can't remember and my eyes are getting blurry!
Here's the link and if anyone has the docs for these please scan them and
I'll put your name up in lights!

That sounds like an idea, although maybe just as difficult. The power supply for the scanner actually plugs into the cartridge along with the scanners cable. I'd need to find some kind of schematics I guess. Thanks, Mo.

> possible? I didn't even know that ST's used cartridges, I've never had one.
> Thanks! Mo

Yeh, the Migraph was one of the most celebrated scanners of the ST world at one time. Of course that is what they tell me... I've been looking back on the ST scene in retrospect since I got into it in 1998. :) Of course the Atari 8 I enjoyed while it was still big.

But the ST cartridge port can kinda be looked apon as being as useful as the Atari 800 right hand cartridge slot. (grin)

I have YET to find a game on a ST cartridge. Mostly utilities. Thus the reason for the example above.

The ST cartridge was a cool idea. Like all things ST, Atari made this 16 bit machine, and gave it everything a modified Atari8 had... OUT OF THE BOX!! 16 bit machine with 512K, moving at a blinding 8 mhz of speed, and a cartridge that could hold 128K of ram. Really cool eh?

Well, while a 128K cartridge would have been cool on a 800xl, it didn't mean dip in the sixteen/thirty-two (ST) bit world. (Star Raiders on the ST is like a 250K game.... I was looking into making a ST cartridge of that game for a bit to finish off my Star Raiders collection... no luck... And I haven't heard of a bank switching cartridge on the ST... yet!)

One thing the cartridge port did offer as Dave Small of the Macintosh emulator for the ST (Spectre) scene would realize, the cartridge port offered a port with a FAST transfer rate. Granted you had to make a special connector with gold leads, but once you had that, you could rig the cartridge port for all sort of transfers.
So the "Cartridge port" became less of what we have come to know in the Atari8 world as a rom based storage device and practically daughter board to the Atari 8's motherboard, but more of a information transfer port.

So you have some STRANGE devices that came out. Like the Migraph hand scanner, ST Replay (a audio in and out jack in cartridge form), various system clock devices, and of course the Spectre GCR, which had a cartridge you could put Macintosh 128K roms on, and then had ports you could plug the floppy drive in to read Mac disks!

There were a few carts that were more the rom based storage devices.
There was a desk accessory cart.. but that requested additional software on
disk to run. Kinda pointless if you ask me... but it was there. And then
there was ONE true rom based cartridge...the VT100 emulation cartridge. Finally
a cartridge my Atari8 world knowledge could identify with. (grin)

And there you have the enigma of the 128K ST cartridge.

If anyone has any question about the ST, I'll be happy to answer. I'm
a Atari 8-bit user first and ST user second. (must like Rick D is also). The
ST is a great utility machine, and had a few improvements over the Atari8 line.
I have fun using both, and am currently typing on my Atari 800 as I look my
Mega ST/2's SM124 screen. ;) They work well together .... sometimes.

I have come to appreciate best electronics. Their 228 page catalog is
worth the $7.50 I paid for it. And I have to say, I spent a long time looking
for a chip for the 850 interface. Finally found it (for $5) from best. They
had the best prices for a Atari laser printer I was working on... what I say..
Best has been good to me.

1227. Atari to PC joystick Interface

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-19 13:51:37 UTC
From: Emmanuel Fernandes <manu@writeme.com>
Message-ID: <96r81riap1@ail.sri.ucl.ac.be>
Source record: 38547

Hi Everybody!

Since many people are asking, before christmas I made the promess that I'll release a two-button version of my Atari-to-PC joystick interface (http://users.swing.be/atari/joystick.html). For people who don't know, this device let's you connect a classical Atari Joystick to your PC through the gameport. No extra software is needed, and it can be used with any Atari emulator (atari 2600 and atari 8bits emulators. It is always better to play old atari games with REAL atari sticks).

I've been working in a new version supporting 2-buttons joypads such as the Atari 7800 joypad. Well, this version needs a lot of work and it is not finished yet. BUT, I have an intermediate version with the following characteristics :
- less electronics (and easier to build) ;
- support also a 2-buttons device : the Sega Megadrive joypad.

For the version supporting the Atari 7800 joypad, you'll have to wait a little bit (I have not enough free time). But enjoy what has been done till now :

http://gauss.math.ucl.ac.be/~manu/a2pc

You'll find there GIF and TIFF versions of the schematics. The TIFF ones have the correct resolution/size to be printed out by any 300dpi laser printer on a A4/letter size sheet of paper.

Enjoy and have fun,

Emmanuel.

1228. Re: ATR8000 8" Floppy Drive Compatability

Newsgroup: comp.sys.atari.8bit

Source record: 38549

These are REAL DIM memories, but....as I recall, the ATR8000 will read hard sectored disks, it might have been able to write them, but I don't think it would format them (the FDC requires there be only one index hole per revolution). The problem with a lot of hard sector disk formats is that the poor little FDC will probably not have the slightest idea what to do with the data. I know that this was the case with the Northstar hard sectored floppies I had, after I gave up that particular computer, I reformated them in my Atari 810 drive.

From: Manuel Polik <cybergoth@nexgo.de>
Message-ID: <3A9184DF.5317E813@nexgo.de>
Source record: 38550

Hi there!

So, I just finished the gunfight page, unfortunately without manual &
interview fot the moment.

More interesting than that little page might be my new project, where I
try to port Gunfight to the Atari 2600 VCS. Looks very promising atm, I
think I can do it. I just updated an early demo on:
http://home.nexgo.de/cybergoth

Greetings,
Manuel

What would really be cool is a interface to hook a PC joystick to a
2600/XL,XE/ST etc ;-)

This bewilders me since the old Atari 8-bits did not
have the date-based filing system like PC-compatibiles
have.

It must have been the design of the SpartaDos
which I never had in my collection of 8-bit software.

Wally

It works with the PC. PC users require a transfer program, "Star Commander",
and a cable, "XE1541", to use the 1541 with PC and load/save C64 software
(or PC software it it fits) to the disk.

> Oh, that remainds me of an idea I had some years ago, but never really

>
> Use a SPEEDY1050 to emulate this DOS inside the 1541 and the read C64
> disks with da real thing.

Don't forget that the 1541 format is recorded in GCR rather than the
IBM-standard MFM. To read/write 1541 disks on anything other than a 1541 or
clone may be very difficult, if not impossible, without major hardware
modifications to the drive controller of whicher disk unit you attempt to
use.

>put into an image, for example .exe game files?

You are still limited to 64 files per directory and so could make 64
subdirectories unless the disk required boot capability. The only limits are
space 64 files in the main directory.

Should work on any platform. It's open source. Was tested on Dos, Win9x
and various x86 lunixes. Don't know if it works on bad-endian (Motorola)
processors. It could also work on low-end computers (ST :-), but will be
probably too slow and taking lots of memory.

> I wuld happy to try to introduce you to the mind behind the 800XLDJ. Such
> a converter would be a wonderful!

If you want to help me, take the Atari disk and make both ATR and DI
from it. Then, take the disk editor, and write something in any empty
sector. Again, make ATR and DI from it. Then zip the images and send me
them.

1252. Running 8-bit disks on a PC driver?

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-20 16:07:36 UTC
From: ebaiz@skyenet.net
Message-ID: <cDwk6.157$c7.687@newsfeed.slurp.net>
Source record: 38576

Hello,

Is there a program that will allow a 5.25 inch PC drive to read Atari 8-bit
5.25 inch disks?

Edward S. Baiz Jr.
(Gamer)

HADES 060: 256meg Ram, Yamaha CDRW Drive, 1 gig Jaz
Drive, MicroTek E3 Scanner, Mach 64 w/4meg Ram, Epson
Photo 700 printer, 56k US Robotics Modem, ICQ#91257633
PROGRAMS: Extendos Gold, Cab 2.8, ScanX, STiK2, aFTP,
Calamus SL2000, Newsie, PlayMyCD, Papyrus 8, Smurf,
Nova Driver 2.67, NVDI 5, Linux, Magic, N.AES, Geneva

1253. 800XLDJ works great...

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-20 16:07:38 UTC
From: ebaiz@skyenet.net
Message-ID: <eDwk6.158$c7.687@newsfeed.slurp.net>
Source record: 38577

I finally tried out the Atari 8-bit disk drive emulator 800XLDJ. I ran the program on my Atari Hades using the ST version. I hooked up a 130XE to my Hades(through the Modem 1 port) using the SIO2ST(PC) cable. I loaded in a virtual DI disk and then booted up the 130XE. I was greatly amazed when the 130XE booted up the program that was on the virtual disk. The other Atari people from my club were also amazed. I then used an old program that was included with the Xformer package called FXP. It allows one to see what files are in a SD or XLD disk and then export them out to the ST computer. You can also import or delete files from the virtual disk also. I had to turn off the caches on my Hades in order to get the FXP program to run. I exported them out to the Hades and then imported them onto the DI disk and booted up the XE computer. It booted up the program instantly. I was really happy. Now if I could just run some of the programs I am finding in ATR format, that would be icing on the cake.

Edward S. Baiz Jr.

1254. Re: Y2K Bugs on 8 bit

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-20 16:10:52 UTC
From: pjr <pjr@NOSPAMyep.com>
Message-ID: <slwk6.2021$MN.30704@news2-win.server.ntlworld.com>
Source record: 38578

There are quite a few Atari Y2K bugs around if you look hard enough. I was going to write an article on the subject once but didn't get around to it. They are generally very minor things such as spreadsheets/database programs that sort items by date and put the 2000 dates at the bottom of the list because 0 < 9. Or else they don't allow you to put in a 4 digit date at all so you can't differentiate between 1900 and 2000, for example.

Paul

1255. Re: I'm singing the Atari800Win Booting Blues

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-20 16:48:06 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3A929FC6.F2E41023@mail.uni-mainz.de>
Source record: 38579

Well,
1) I tried to convert these SIO2PC 184336 bytes long images with Imagic to another format (DCM,XFD,SCP) but it did not work. Imagic starts the convert process but then stops and writes: unknown source or corrupted image. 2) I also tried to use DD ATR images of 183952 bytes length with SIO2PC and it responded: Error - not an ATR image. Looks like we need a little converter, that converts between SIO2PC and Atari 800 WIN DD Images. Or just an update of SIO2PC (or Atari 800, Win, Plus,etc.) that accepts both filelengths... -Andreas

Piotr Fusik schrieb:

Yeah,
you are correct. Since I know some of these guys quite well, I also sold them defective software. They did not mind, because they never wanted to play it, they just wanted the original stuff (disk+label, manual, package, etc.). Sounds stupid, doesn`t it ?? They could have the same, if they would just use a scanner, and copy the disk labels, manuals and packages and use any blank disk. Maybe we should just sell them blank disks with the proper labels, manuals and packages, they would never notice it... -Andreas

Well Daniel,
ask Raimund Altmayer (highland@t-online.de), maybe he can help you. He
uses the XLDeejay quite often and has many .DJ images flying around.
But, he is not an assembler programmer, thus he could disassemble the
XLDeejay but he cannot help you in any way with this disassembled
source. And finally, I am not quite sure if the DJ was really written in
Assembly language (maybe C, C++, Turbo Pascal, or any other Atari ST
programming language)... -Andreas

Well,
a good idea, killing these collectors, especially since we do not have
electric chairs here in germany. But, what if I notice any copy
protection on Gunship or other collector items ?? I am not a hacker,
thus I cannot remove it or create an ATR image of it. And I do not own
the Ape Pro System. Thus, after having killed these guys, I must have
enough time to give the software away to other Atarians, who can remove
any copy protection. If I get caught by the police before I could give
the software away, you may have to wait 15 to 30 years until I can
contact you again. Quite risky, isn`t it ?? (Just joking!) -Andreas

Well,
and don`t forget the trash collectors (funny guys that collect
everything). Here in Germany (and in USA also I believe) we discover
more and more people that have this desease. Their rooms or houses have
to be cleaned by officials (coming from the health ministry) to avoid
further bacteria, insects, virusses, etc.
Especially when these trash collecting people die, their rooms have to
be cleanded for many weeks. Maybe in some ten or twenty years, we have a
new sort of trash collectors: computer trash collectors. Their museum(s)
will merely consist of computer trash then, old computer soft+hardware
no-one knows or needs anymore, that will be thrown away of course. So,
what some users collect today, might be simply thrown away in some years
(after they die). Just think of that many people who do not know Atari
at all. A house (or room) containing hundreds of Atari items might be
worth a whole life for Atari collectors, but absolutely nothing for
those who do not know Atari. For them it is just some sort of trash,
which has to be thrown away then... -Andreas

Seems like we have been thru this a lot lately.. The answer is a qualified yes;
AtariLink, sometimes called AtariDisk can read/write double density 256 byte
per sector MyDOS type disks in the PC 5.25. This is from HiasSoft in Austria
and works well for me. There is another AtriDisk by Charles Marslett which is
often called AtariUtil and was very hit and miss in my experience.

Look here near the bottom for some info:
http://ch.its.tudelft.nl/~sidney/atari/
on AnaDisk which reportedly will read single and enhanced density A8 media.

btw there is a new AtariUtil for Win9x by Ken which is an excellent tool to
manage all of your .ATR, .XFD and some .DCM images.

Similar naming makes your head swim after a while...

I need a short, flexible routine to draw a circle for a program I am writing. I need the BASIC code to draw a circle with radius R at coordinates X,Y, where X, Y is the upper left hand corner of the imaginary square which would contain the circle.

Is there a mathematically inclined person who can assist me with this?

There are a number of ways to approach this. But first: are the circles to
be solid or outline? How critical is speed vs accuracy? What graphics
mode (or does it need to be a generic routine for all modes)?

A few more details and I'll dust off my BASIC thinking cap...

David P.

1269. QUESTRON for Atai 8bit..

```
Dan, Dave.
It's 2AM and I did the following. It is unusable for its slowness,
but it is a mathematical circle, like Dave's, but comes out like an egg
because graphics 8 doesn't have equal size rows and columns.
(The end of my suggestion is to get "CIRCLE.BAS", a machine
routine, generic like Dan wanted from ftp.spudster.com in
games/bas/c/cirlce.bas.) It is a machine routine, but is in BASIC so
you can use it in your program.
heres what I came up with.
********
2 GRAPHICS 8
10 R=30:R2=R^2
11 COLOR 3
12 PLOT 50,100
20 FOR X=50 TO 110 STEP 2
30 K=X-80
40 H=SQR((R2)-(K^2))
50 Y=H+100
60 DRAWTO X,Y
70 NEXT X
80 PLOT 110,100
90 FOR X=110 TO 50 STEP -2
100 K=X-80
110 H=SQR((R^2)-(K^2))
120 Y=100-H
130 DRAWTO X,Y
140 NEXT X
150 GOTO 150

(I did it on atari800 emulator, don't try XLIT, because XLIT won't do the
^ power function.)

I was thinking of an outline circle, which I could then decrease in
size in a series if necessary, filling in the circle. It should be a
generic routine for all modes. The other drawing I'm doing is PLOT and
DRAWTO type stuff.

There may very well be some problems and bugs, but I was just poking
fun at the game's poor quality. I would like hear others's opinions on
this game, which IMO is horrible.

From: david_p@istop.com
Message-ID: <982727978.161421@ip195>
Source record: 38448

OK, here goes. Keep in mind I'm doing this with my Atari 800xl still boxed from my move a month and a half ago, so this is all from memory without being able to try it out. I am not including any bounds checking either; if your program passes X Y and R that go beyond the graphics mode, ERROR.

Circles will call the floating point system; unfortunately, it is notoriously slow on a stock Atari 8-bit. One way to speed things up is to pre-calculate values that will be needed, and store them in an array. I'm using 10 degree separations; given the screen resolutions, this should be adequate. Circles won't be perfect, but should be "good enough"

Thus, rather than calculating cosines each time each circle is drawn, have an init subrutine that does something like:

```
30000 DEG : REM Use degrees (instead of radians)
30010 DIM COSINE(35),SINE(35):REM Pre-calculate every 10 degrees
30020 FOR I=0 to 35
30030 COSINE(I)=COS(I*10):SINE(I)=SIN(I*10):REM Fill array
30040 NEXT I
... and more init goes here...
32767 RETURN
```

Now, when you need to draw a circle, do something like:

```
1000 REM Circle routine: requires X,Y of top left, R radius, C color
1050 REM Uses local variables CX, CY and I
1010 CX=X+R :REM calculate center X position
1020 CY=Y+R :REM calculate center X position
1030 COLOR C
1040 PLOT CX+R,CY+R:REM plot 3 o'clock position
1050 FOR I=0 TO 35
1060 DRAWTO CX+R*COSINE(I),CY+R*SINE(I)
1070 NEXT I
1080 DRAWTO CX+R,CY+R:REM back to start
1090 RETURN
```

You can even add

```
30050 CIRCLE=1000
```

and then have lines like

```
X=10:Y=10:R=50:C=3:GOSUB CIRCLE
```

To get even faster (but less circular) circles, go to 20 degree intervals, changing the arrays and indexes to a maximum of 17 instead of 35, change the pre-calculations to 20 (ie SINE(I)=SIN(I*20)); you'll have half the

number of lines to draw.

Hope this helps,

David Paterson

1277. Where to buy sio2pc cable in USA?

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-21 04:05:16 UTC
From: Omar <omar27@earthlink.net>
Message-ID: <08Hk6.146$v77.24392@newsread2.prod.itd.earthlink.net>
Source record: 38450

Hi all,
I have recently acquired a mint condition 800xl, 1050 floppy drive,
Commodore 1902A Monitor, and original instruction manual. I have no
software yet, but have ordered mydos on cartridge.

I would like to be able to connect my PC to the Atari in order to use
downloaded software. I have seen the various sites explaining how to make
your own cable, but I would rather purchase this cable from someone if this
is possible.

I did not find this cable for sale anywhere. I have looked at the Best
Electronics website, Jameco, and a place called JDR but none seem to have
this cable listed.

Will someone assist me in obtaining one? I will be happy to prepay for the
item. See my positive feedback on eBay if necessary:
http://cgi2.ebay.com/aw-cgi/eBayISAPI.dll?ViewFeedback&userid=omar27

Regards,
Omar

Sounds just like my basement. I have lot's of computer trash down there.
:-)

Some Atari, some Commodore, some older IBM compatibles. Strange, there's
no Apples.

But of course it has value to me and I'm going to put it into my will
how it is to be taken care of. Let's hope there's Atari interest 50
years from now.

1283. Re: Y2K Bugs on 8 bit

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-21 06:20:03 UTC
From: w_a_lang <w_a_lang@willinet.net>
Message-ID: <t96nghe86dgg86@corp.supernews.com>
Source record: 38456

Hello Everybody,

I was re-evaluating some of my Atari 8-bit software and
it appears, there really were quite a few, Atari Y2K bugs
after all. But in the case of the Atari, it is how the utilities
were programmed, such as spreadsheets and accounting
tools. The Y2K bugs which appear seem to deal with a
common date feature, that can retooled, if you have the
to right programming language to write with. I was just
about to write for myself a modification, for a tool that I
got from Compute magazine, when my floppy drive had
crashed. I know that it does not have anything to do with
date-based file storage however.

Of course I believe that Paul got it when he said:
>
> They are generally very minor things such as
> spreadsheets/database programs that sort items by
> date and put the 2000 dates at the bottom of the list
> because 0 < 9. Or else they don't allow you to put in
> a 4 digit date at all so you can't differentiate between
> 1900 and 2000, for example.
>
Well Paul it should be handled with carefully measured
response that includes changing the date codes in all
sections of the program. The Atari 8 bit program of
"Financial Wizard" by Computari may have a Y2K
bug in it, but if you have the right tools you can fix it.

Harvey Klein said that:
> >
> > When preparing a year data disk, the year 2000
> > is not accepted. Seems that years cannot end
> > with 2 zeroes. 2001 works fine.
> >
At least for now you don't have to worry about it for
another one hundred years.

Well, as I've mentioned in other posts, Avalon Hill Games have always been 'campy' their collectability lies in the packaging they used. The large heavy boxes with colorful graphic artwork really stand out on the old bookshelf. The documentation was usually just a small pamphlet like you get as a CD insert these days. I believe AH was the first to mass market 'cross platform' computer tapes. They usually included versions of the game for TRS-80, Atari, Pet, and apple. All on the same tape, which made searching for your version on the tape and loading it, all that much more fun!
I posted them because they're probably the only genre of computer game that I haven't seen available on the net. I have some AH bootable games like Moon patrol and Flying Ace (now that's a crappy game!) I'll be posting some time over the next week. Mo

Are you sure the problem is as I described?
Atari800 can check first 3 sectors to see if they are SIO2PC (384
bytes data + 384 zeros), so it will boot such images.

IIRC, about 30 MB and a number of prototypes. I saw 3 at the Atari warehouse sale, Bob Brodie has one that he loaned to Bob Wooley to check out. Not a lot of them, that is for sure.

I just wonder if this is the same one that has been offered twice before and pulled with one excuse or another. It doesn't look like the ones I have seen.

1300. Re: How Can I Draw a Circle in Atari Basic?

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-21 22:36:42 UTC
From: DCM01@USA.NET
Message-ID: <3a943db6.34576837@news.CIS.DFN.DE>
Source record: 38474

I typed in the programs Dave and Russ provided. I get a blank screen with Dave's. I don't know if I need to put something where it says "and more init goes here?"

Russ' worked fine after I realized that there actually was an Atari key "^." After trouble customizing that (I don't really understand what the code is doing) I decided I might as well try myself. Here is my circle code.

```
10 R=25: X=80-R: Y=40-R: GR. 7: COLOR 1
20 REM CIRCLE
30 FOR R=R TO R+1
40 FOR T=0 to R
50 PLOT X+T, Y: DRAWTO X, Y+R-T
60 PLOT X+R*2, Y+T: DRAWTO X+R+T, Y
70 PLOT X+R*2,Y+R+T: DRAWTO X+2*R-T, 2*R+Y
80 PLOT X+R-T, 2*R+Y: DRAWTO X, 2*R-T+Y
90 NEXT T
100 COLOR 0: X=X-1: Y=Y-1: NEXT R
```

Mine is faster than Russ' but has the unfortunate side effect of wiping out whatever might be drawn in the corners of the imaginary square holding the circle. But that doesn't matter for my current program in progress.

I had a quick look at Midway and Andromeda Conquest which you uploaded. Those seem to be well-programmed BASIC games with a lot of things going on. The problem is they are all text-based, taking advantage of none of the Atari's gfx and sound capabilities. Even the text is indented far left, leaving gobs of space on the right of the screen.

It looks like these were ported over from another platform alright. The BASIC appears generic enough that it wouldn't require a lot of effort to port it between platforms.

Maybe there is a reward in play value for the person who gives Midway or Andromeda Conquest some time, but it doesn't seem like much fun upfront.

Source record: 38476

There's a funny story behind the two different versions of this game:

The author, Scott Jaeger, wanted to demo it at a consumer electronics show but hadn't finished it. This is the longer, prototype version with the "Dating Game/Whipped Cream" theme music and stamping god. He registered for the show anyway, but could only afford a cheap booth. He found himself surrounded by porn vendors!

Parker Brothers execs found him and offered to distribute the game. They changed the hero's hat to an Indiana Jones-style panama, renamed him "Panama Joe", shortened the game and added the initial practice room and "jewel room" ending. This is the 16K version.

I don't know what they were doing in the porn section ;-)

And thus speaketh the crusty old Atari historian...

-Anthony Ramos

p.s. Before this he wrote a nice conversion of arcade "Kick" called "Kickman".

in article 93lu8ijce1@news.netvision.net.il, Itay Chamiel at itayc@surfreespam.net.il wrote on 01.11.2001 19.40:

: size in a series if necessary, filling in the circle.

That's definitely the SLOW way to do it :) Unfortunately, due to
the inaccuracy between floating point numbers (ie, the values in the
variables you get back when you play with COS and SIN functions),
some pixels will be missed when you try to fill by reducing the radius.

To compensate, you need to reduce the radius by much smaller steps, which
makes it take that much longer to draw.

Out of curiousity, would using TurboBASIC be out of the question?

As I recall there were cases for about 75 I don't know how many populated
boards
ask Curt Vendel for more info regarding this.
I have 2 Populated boards that I built By hand from Atari 1450XL boards.

1306. Version 0.5 of a8jdpeg, Atari 8-bit JPEG viewer

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-21 23:42:31 UTC
From: Raphael Espino <rjespino@yahoo.com>
Message-ID: <m3ofvviowo.fsf@islita.localdomain>
Source record: 38480

```
The latest version of a8jdpeg, the jpeg viewer for the Atari 8-bit is
now available for download. a8jdpeg is an Atari 8-bit port of the
C=64's juddpeg, written by Stephen L. Judd.

It is available for download at either of these addresses:
http://rjespino.atari.org
http://rjespino.webhop.org

The main changes are:
o Added HIP viewing mode
o Added HIP save mode
o Reduced flickering in flicker modes
o Files can be selected from the directory list
o Wildcards can now be used when loading files

Enjoy!

Thanks for that. I think you're right on that, at some point I'll
create a separate slideshow version that will default to displaying
all the files with a .JPG extension in the current directory in HIP
mode (added in the newest version). Plus having an option to change
the display mode(s) used, and to save the configuration to disk, so
that if you really want to you can start it up in other modes too.

Source record: 38482

Mine wasn't quite complete. It includes two routines: the initialization
at 30000, and the circle drawing routine at 1000.

Try adding these lines:

```
10 GRAPHICS 0:? "Initializing..."
20 GOSUB 30000
30 GRAPHICS 8
40 ? "Input X,Y, Radius:";:INPUT X,Y,R
50 GOSUB 1000
60 ? "Press C to clear screen, Q to quit, any other key for another
circle";
70 OPEN #1,4,0,"K:"
80 GET #1,A
90 CLOSE #1
100 IF A=ASC("C") THEN 30
110 IF A=ASC("Q") THEN END
120 GOTO 40
```

This will let you input different X,Y and Radius values and see them.
After each circle, you can Clear the screen, Quit, or draw another one.

Hope this makes a bit more sense,

David

Life kinda got in the way; since then I've moved a few times, started a new job... the usual sort of things that drags you away from your Atari(s) for a while. But I'm getting settled in my new place here in Ottawa; I've just got ADSL; I've just won an Ebay auction for an 800 (4 player MULE again!); and I'll have an Atari or two up and running in the spare room Real Soon Now.

> by a Commodore guy
Well the hard part - actually decoding the jpeg - was done by a
Commodore guy (Stephen L. Judd), and he did a fantastic job too! This
bit was ported from the C=64 to the Atari.

The easy part - taking that data and drawing a picture with it - was done
by a second person (Adrian Gonzalez) on the C=64, and by myself on the
Atari and was written almost from scratch.

> he obviously watchs what has been happening with the Commodores...

Actually I can't claim credit for that either, the people who pointed
me in that direction were Mathy Van Nisselroy and Rene de Bie. The
closest I've come to a C=64 was installing a C=64 emulator to run
juddpeg on. But I do think that cooperation between the C=64 and the
Atari 8 (rather than arguments as in the past) are the way forward.

<ewilliams1@jam.rr.com> grabbed chalk and scrawled:

>well I sent the seller email asking for a pic that I was NOT gonna bid on it
>without a Real Picture.... to date no response.

Just ask them if it has a Tong motherboard.

If they can't answer, they don't have the machine ;) They've claimed to
have upgraded parts of it such as the video, so they can't use the
excuse that they 'don't want to open it'.

Straight from the description:

"...I have the right the stop the auction and sell inside/outside of
ebay if an entertained offer sounds pleasing to me..."

In other words "Just because you are the high bidder, don't think I'll
sell it to you."

Should be interesting to follow.

If anyone in this forum successfully bids and acquires the unit, let us
know.

>Compute! once published a little article and program in its readers' letters section that told you how to directly access the extra 128k<

Compute! did publish an article and program routine to allow using the XE's banked memory to store data for BASIC programs. It was called "Access" by Mark Slagell. December, 1986, pg. 79. The machine language routine was in the form of a BASIC -> ml file maker using data statements.

Ian,

I agree, thats my 1450XLD, not his. He stole that picture from my website
and also in his description he fumbles:

He mentions how the drive is an Epson but looks just like a 1050 {buzzer}
Sorry, wrong answer, tell him what his consolation prize is.

In the 1450XLD's you either had working custom Epson drives connected

-or-

You had a 1983 CES mockup system with 1 or 2 Atari 1050 drive mech's
installed but not attached to anything since they weren't standard drives.

So the fact that this is yet the 3rd auction of a 1450XLD from someone out of
New Jersey like the other two, he has no real photo except the one he stole from
my website and he messed up on his supposed description of the unit, I wont be
surprised if at the 11th hour this guy pulls the auction yet again.

Just my two cents.

Curt

I also emailed the seller with this message:

Is this a actual picture of the 1450xld being auctioned? And if I may
ask what is the serial number of this unit? What type of memory
expansion was done?

Don

I got this message in return:

Cut from original message:

This is not the actuall unit. My unit looks identical except I dont have a
camera to take a picture and put on ebay. It does have a sticker on the top
with a number. Maybe this is the units production/test number.

I actually ripped out the memory chips that came stock in the unit. 8...8K
chips. I replaced them with larger memory chips which gave the unit a
considerabley larger amount of memory.

There is only one 1450xld like this one. I was even thinking about ripping
out the 300 buad modem and putting in an internal 56K data/fax modem.

****

Take the above for what its worth.

1321. Atari 1200XL - Some questions

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-22 03:44:07 UTC
From: Kris Kelley <skunk@kingwoodcable.com>
Message-ID: <B6B9E727.11FE0%skunk@kingwoodcable.com>
Source record: 38495

Hello all.

My foray into the Atari 8-bit world is fairly recent, having been raised on Apple IIs and then feasting on Commodore 64s later on. However, in the past couple of months I have picked up an Atari XE game system with keyboard, an Atari 800XL, and a host of games and peripherals for them.

My most recent Atari acquisition is a 1200XL from the local Goodwill. The thing *almost* works, enough to make me think it's fixable with the right spare parts. However, I've become a bit confused about all the litte differences between the various Atari 8-bit incarnations, so I'm not 100% certain I've diagnosed the problem correctly. My questions:

1. The FAQs I have read mention that the 1200XL does not have built-in BASIC. So, what's supposed to happen when you turn the system on with no cartridge plugged in? I get the Atari logo with rainbow effects on a black background. Is that what I'm supposed to see?

2. Reason I ask #1 is because I think I have a dead keyboard. I can't get it to work with any of the cartridges that require keyboard control. I also can't get it to work without cartridges, but that's moot if the computer's not supposed to do anything without cartridge or disk input anyway. Everything else seems to be working okay; cartridges load fine, joysticks are functional, and disks can't be tested because the system and my 1050 drive are sharing the same power cord. So, are the odds that I just have a dead keyboard, and everything else is okay? In other words, is there something irreparable that could happen to the motherboard that would cause the keyboard to die and everything else to be okay, and if so, how likely is that to happen?

3. The FAQs also mention that none of the XL machines have separate chroma/luma outputs in the monitor port. Yet, I've got this machine plugged up to a Commodore 1702 monitor using a generic 4-tailed cord, and getting separate chroma and luma! Are the FAQs mistaken, or is it that a handful of 1200XLs did have video signal separation? I suppose this could have been the work of a hobbiest, but I can't imagine somebody putting that much work into the system and then dumping it in a thrift store!

4. Assuming I can get the 1200XL working, what's the best system to keep, from a gamer's point a view? I really don't need three virtually identical computers, since I'm not that much of a hacker.

Thanks for the time and any answers!

---Kris Kelley

Seems to me to be a load of BS

the way the 1450XLD is built you just can't rip the old chips out and put in BIGGER chips.....
also the chips in the 1450XLD are 64K x 1 not 8Kx8
also ripping out the 300 would be easy but putting a 56K in it's place would not be worth the effort.
sorry just my .02 cents
thanks
Ed

1325. Airball

Does anyone know of Airball in any file format that I can play on one of these 8-bit Atari emulators? I used to have the cart for my 130XE, but I foolishly sold it off quite a while back.

I actually have a brand-new in the box ST version of Airball (but I never owned an ST...hence the box never got opened). I finally got an ST emulator to work on my PC a couple of days ago but apparently the pristine/unused Airball disk deteriorated over time and it does not seem to read properly.

It has a really robust keyboard and connector. If it isn't working, I would think POKEY chip. They can be found, couple of bucks.
> 3. The FAQs also mention that none of the XL machines have separate

Nope, the signals are not separate chroma and luma, but composite and luma or something like that. It does look much nicer then composite alone anyway.
>
> 4. Assuming I can get the 1200XL working, what's the best system to keep,

800XL. But a lot of people such as myself consider the 1200XLs to be precious. I have about 5-6 of them I have picked up so I would be sure to have a lifetime supply.

1200XL's are notorious for dirty keyboard contacts, just keep tapping on the
key like forever and if the keyboard isn't bad just dirty. It will start
typing, I have to take mine apart every few years and clean them. Even at
that when I have one in storage I've not used in a while, I still have to do
this.

One other aspect that just doesn't make sense, at least to me, is:

You advertise a rare vintage computer and then proceed to explain how
you've "modified it". Doesn't that ruin it's collectible value? If I buy
something like this, you can sure bet I want it in its original
configuration, not something that's been hacked apart.

Anyway, thank you's are in order to those that responded to my pleas
about the Black Box power supply. I now have one. I will be connecting
it to the 130XE soon.

Any recommendations against temporarily swapping out the POKEY chip from the 800XL or XE system to test? That's assuming these systems have socketed chips. I haven't been initiated for the soldering iron just yet.

> Nope, the signals are not separate chroma and luma, but composite and luma
> or something like that. It does look much nicer then composite alone anyway.

Okay, that makes sense when I think about it, though I would swear I tested this same cable on the 800XL and didn't get a good picture, no matter what combination of the tails I was using. Maybe I just missed the right combination.

I think he's trying to sucker someone into making an off-line deal for an imaginery machine. Once you deal outside of E-bay you lose all of the buyers protection they give you and a claim of fraud is alot harder to prove. You gotta give him credit, he's one smart criminal! The last few auctions like this, I'd bet several people lost hundreds of dollars.
Mo

Curt Vendel wrote in message
Ian,
I agree, thats my 1450XLD, not his. He stole that picture from my website and also in his description he fumbles:

He mentions how the drive is an Epson but looks just like a 1050
{buzzer} Sorry, wrong answer, tell him what his consolation prize is.

In the 1450XLD's you either had working custom Epson drives connected

-or-

You had a 1983 CES mockup system with 1 or 2 Atari 1050 drive mech's installed but not attached to anything since they weren't standard drives.

So the fact that this is yet the 3rd auction of a 1450XLD from someone out of New Jersey like the other two, he has no real photo except the one he stole from my website and he messed up on his supposed description of the unit, I wont be surprised if at the 11th hour this guy pulls the auction yet again.

Just my two cents.

Curt

Ian McLaughlin wrote:

I *thought* I recognized the picture. Took me a little bit of thinking,
then I found it. Check out:
http://www.atari-history.com/1450xld.html

Sounds like a hoax to me. The guy has a 1450XLD, and can't even take a real
picture of it? He has to steal a picture from the web?
Like everything else on eBay - CAVEAT EMPTOR.

Hey WOW! Thanks for the info!! I'll probably snatch up an ST if I find one on the cheap. But I don't think I'll actually go 'looking for one'. Looking at some of the old adverts, it seeems they really beefed up the graphics and sound on these machines. But I haven't seen hardly any support for them on the web as I have the 800/XL. Thanks again, Mo.

CO12294 is the POKEY chip. Hopfully you will have socketed chips on the
800XL, all 1200XLs are socketed.

They didn't bring all the lines/signals out on the 800XL. There was an
article/letter in tips section<something like that> in ANTIC magazine for
adding the signal back in. Fairly simple, just a low value cap and 6" of
wire.

1338. Looking for the font from steath or landscape

Hi there !

In the mid 80s a game came out which was first called 'landscape' and later 'stealth'. It was a 1st person shooter where you fly a fighter through energy fields.

I extracted the font and printed it, but now I can find it anymore since I sold my atari about a decade ago. The print-out is vanished too.

If someone possess the game or has extracted the font - please send me a mail !

Hello
I have a complete working 2600 system available that comes complete with the unit, switch box, two controllers, two paddles and 25 games
The games are:
Dragon Fire
Centipede
Star Raiders (with manual)
Combat
Frogger
Venture
Space invaders (with manual)
Raiders of the Lost Ark (with manual)
Super Breakout
ET
Mario Bros
Warlords (with manual)
Spider Fighter
Superman
Pac-man
Baseball (with manual)
video pinball
berzerk
kangaroo
stampede
defender
demons to diamonds (with manual)
deadly duck (with manual)
fishing derby
Vanguard
Games all work and are in great to average condition.
Asking $100 and I will pay shipping.
No reasonable offer refused.

Well, here's my thing: If you keep records, you will know. That's why I like sites like the Obsolete computer museum...you get to see some of the old junk in its element, as a working computer. If these old 8-bit klunkers can last 20 more years, maybe some grand and great-grandkids will make fun of them... Not the best light to remember it all in but at least it's remembered.

Poor man. I try to keep my stuff trimmed down. My parents really don't care that I have it (they actually see the practicality of having 15 serial mice) but my friends still think I am mad for having a 20 year old computer. Heck, it works :)

Yea...and there's Pac Man which is a pain in the butt to play with even a
joypad...
I'd be happy if there were a hack that would make a Genesis gamepad safe to use
in a 9-pin port.

Absolutely. I'm sure that Atari as it was 15 years ago assumed no one in their right mind would be using an A8 in the next millenia.

It's pretty rare but I don't know that it lives up to:
"considered the most rare computer EVER in the history of vintage
machines. NOTHING is as rare as an XLD"

What statistical basis does he have for making this claim? I mean, it IS
a rare piece, and it might be the rarest of all Ataris, but I don't know
how you'd be able to make a claim as bold as that.

That's another thing.. why would you tamper with something so rare as a 1450XLD?! I mean, what if you screwed up the job, now you just ruined something that's irreplacable! And he threw out the shielding?! again, why would you throw out part of something that rare, even if it'll run without it?

There is a lot of documentation on the web as how to make the SIO2PC cable.
I made one using an existing SIO cable and a single IC that I found in a
parts bin at work. It cost me nothing and works great with APE '98.

Message-ID: <3a95cf38$0$1520$53a6afc1@news.erinet.com>
Source record: 38432

Others already answered you. You get the rainbow screen with
no cart or boot disk, right.
You said you think the keyboard may be bad, or not working.
Rick C. said a new pokey might fix it, if it isn't working.
What I wanted to mention is the built in test modes for the 1200xl.
At the rainbow screen, hit HELP and the test screen comes up.
Hit SELECT twice and you are at the keyboard test. Hit START
and you should get a screen with all the keys. If the key works, it
beeps and lights up (inverses) that key on the screen.
This is the same test in 800xl, but with 800xl, you turn on with no
drive or cart and BASIC comes up, you then type BYE at the
READY prompt to get to the self-test.
As for which one to keep, it is a matter of your likes.
Some like the 1200xl for the keyboard and I like it for the fact
that it seems to display more vivid colors than my standby, the 800xl.
There's a graphics and sound demo I ripped from a Compy Shop
demo disk, plays 'house of the rising sun' and does a fantastic
kaleidoscope.
That demo looks really poor with an emulator. All you get is good blues
and greens, the reds, yellows, purples are just lost with an emulator.
The same demo on an 800xl looks fair, but not as colorful as on the 1200xl
for some reason.
If you're going to get rid of a machine, I'd suggest the game one. The
later built A8s have a poorer keyboard and are not socketed (easily
repaired).
My opinions.
The problem with the 1200xl is the lack of a PBI. If you don't plan
on getting a Black Box or MIO, then I'd keep the 1200xl. It is most
likely to last longer.
Bob Woolley, a big A8 hardware person, uses 1200xl almost exclusively
because of the sockets and room in it for hardware things he does.
He's even added a PBI to it, but that's not something most would do.
I think the best composite picture on a stock machine is the 130xe, but
there again, the 130xe keyboards fail oftener and there's not many sockets
in it, if any, can't remember. The best composite picture would come
with a video upgrade modification, published in Atari Classics magazine
for all but the 800 and 400 (1200xl, 600xl, 800xl, and I think the 130xe.)

Inform everyone that communications have completely broken down.

1355. Two demos ripped from Compy Shop disk

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-22 23:12:02 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3a95e14a$0$1510$53a6afc1@news.erinet.com>
Source record: 38436

I was talking about a demo in another post. 'House of the Rising Sun'
music while a kaleidoscope displays. I ripped it out of a Compy
Shop demo disk. I made it just play over and over.
There's a second demo, only white dots, not lots of colors like the
first, with good music.
Anyone wants to re-live those Compy Shop demos, on emulator or
real thing (I'd especially be interested if someone compares 1200xl
and other A8s.), I've put them on my website.
Note that IE 5 messes up the filename. It is named A8DEMOS.ARC.
Unless you give the name at the save to disk screen, it gets saved to
desktop as a8demos.ar..arc. Dumb, then you have to rename it.
Just type in the name a8demos.arc or A8DEMOS.ARC and it will
get saved to the desktop with the right name.

1356. Cheap 64MB+ flash disk for retro computing

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-23 00:39:59 UTC
From: "V. Longo" <vlongo@home.com>
Message-ID: <3A95B351.751B229A@home.com>
Source record: 38423

I recently aquired a CABO mpeg player from Best Data. It is a very small, light, hand-held device with battery backed ram. This device uses a parallel printer port to transfer data back and forth between a PC and itself. The idea occurred to me that if you prepared data with a driver that creates a suitable dummy mpeg file format, you could encapsulate any data, and transfer it back and forth between any computing device and the CABO. This would be a neat thing, because, if you made a driver to wedge the OS to use the parallel port as a disk drive, you would have a cheap battery-powered storage device, suitable for embedded applications.

This is cool, because you could then build a portable 130XE into the casing for an NTSC LCD panel, run a keyboard externally, and wala, you have a great tablet-like PDA that runs Atari software without consuming a lot of power. Multiple drives could easily be used in a 'bank-switching' fashion with a physical switch to divert parallel port data from bank A to B to C.

It will take a bit of analysis to determine the handshaking involved during normal communication with a PC, as the 'Jazz-piper' application software is not available in source form. I think that a passive monitoring system between the two devices should do the trick. Does anyone have any leads on this?

This project should provide some interesting engineering challenges, in that a new OS rom will have to be burned with the I/O wedge, to allow for booting without other disks.

This seems to be a worthwhile project, because, if we can make this data available, similar devices could be made for other retro machines (Amiga/C64, or anything with a parallel port option).

I'm interested in trying this, so if anyone else is so inclined, please contact me at vlongo@dppl.com

Thanks,

Vincent

1357. Re: 65xe keyboard

Newsgroup: comp.sys.atari.8bit

Very quickly hit the key 111 times, as though it was the 'fire' key in asteroids, it should fix it. if not, open the case and disconnect/reconnect the keyboard connector itself 7 times quickly. this will fix it. Else replace the keyboard.

If the above procedures fail to provide the desired results, drop the computer at least 12 inches onto a hard surface.

If the above fails to work, replace the machine, it's cheap.

Vincent

I noticed I was having trouble getting perfect symmetry, in whatever
circle routine I was using. It would be a circle but you would get
variations of a pixel here on the left and a pixel higher on the right
etc. I did come up with code that is acceptable for the task at hand
(which is a 3D Dungeon game).

>To compensate, you need to reduce the radius by much smaller steps, which

>Out of curiousity, would using TurboBASIC be out of the question?

I would love to know more about TurboBASIC. I noticed a lot of the
Polish and Eastern Europeans who were doing the most advanced 8bit
programming ever, like the 256 color mode and MOD players etc, were
using TurboBASIC. I have a 64k Atari 800 but I don't think it will run
straight TurboBASIC which is for XL's and XE's. I found Turbo800 which
is the watered down Turbo for 48k Atari's, but I haven't worked with
it much yet. Another BASIC I bumped into was Frost BASIC, which also
has something to do with Turbo.

I would be interested to know also about the compiler for TBASIC and
if it requires a runtime module etc.

To follow follow up Curts post, I was the "winner" of an E-Bay auction for a 1450xld
on March 5, 2000. Here are some of the events that occurred at that time.

1. Auction was pulled one day early.
2. Seller answered a question concerning a picture of the item under a different name and ISP account.
3. Didn't have a camera.
4. "Seller" was from New Jersey.

I never got the machine, but at least, I never sent any money.
Copy of winning notification follows:
"Dear 1208 and 8bitfan, Congratulations - this auction successfully ended.
Item Title: ATARI 1450XLD COMPUTER COMPLETE!L@@K! (Item #269698907)
Final price: $735.00
Auction ended at: Mar-05-00 17:11:07 PST
Total number of bids: 40
Seller User ID: 1208
Seller E-mail: totaleman@excite.com
High-bidder User ID: 8bitfan
High-bidder E-mail: rj5jackson@mindspring.com"

Yes the TurboBasic package is in 3 parts; the interpreter which can load and edit and execute files, the compiler which creates some pseudo machine code file, and the runtime module which executes the compiled modules.

I don't know if a compiler and runtime exist for Turbo800.

>DCM01@USA.NET (Daniel Miller) asked:

If "DD" means double density A8 disk, then try AtariLink form HiasSoft.

If it means "disk drive" like 810 or stock 1050, then alas - no. You are
correct; I have not been able to do it with Anadisk...

Larry was correct about the Dec '86 issue, but it was a bonafide article in the main magazine section instead of the letters column. It still uses 16K blocks only the USR code in the background makes it appear to you as a 64K hunk; all in all a pretty snazzy little utility...

Hmmm...., gets me wondering. Since he's willing to entertain offers
outside of ebay, maybe someone will send him a message and offer
$1,000.00 for it with the stipulation that he send it COD.

Since it's outside of the ebay umbrella, the "buyer" isn't bound by
ebay's rules either. Of course, he'll probably not do the COD thing, but
it may be worth a try.

Or maybe the New Jersey Attorney General would be interested in a fraud
case. They send a check/cash/money order/whatever and then bust him when
he doesn't provide the goods. The money amount involved qualifies it as
a felony.

Of course, this is all speculation and I'm not encouraging anyone do
anything deceitful or illegal. Just mulling over some scenarios.

Hahah, this reminds me of the box of mice I brought at an auction. 80
serial mice at 40cNZ(about 15cUS) each... :-) Even after giving them to
everyone I know that could use one, I still have around 30 in a bag stored
in the roof...

Of course, now I use PS2 or usb mice, thus no real need for serial mice...

Unfortunately that wasn't the problem. Both the 800XL and the 1200XL work
the same with each other's POKEYs. Guess I'll be on the look-out for an
extra keyboard.

Still, thanks for the info. It's always a learning experience opening these
things up. Now I know why repairmen get paid by the hour; there's too many
darn screws in those things!

>4. Assuming I can get the 1200XL working, what's the best system to keep,
>from a gamer's point a view? I really don't need three virtually identical
>computers, since I'm not that much of a hacker.
>
>Thanks for the time and any answers!

The 800XL is the better gamer. One of the reasons the 1200XL rather
flopped is because it had some compatibility issues, and the lack of
an internal BASIC also put a lot of people off it. But as has already
been said, the 1200XL is still considered a collectors item and worth
keeping just for that. Plus, many agree it had a very nice keyboard.
:-)

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

I've done some trading and buying from other Atari Dealers. I'm Adding to my stock & catalogs. Also, I have some Atari ST Hard Drives I don't wan't to bother with, like SH204, a MegaFile and I think some Supra's. So if your interested? Make me an offer. Like I mentioned earlier, I acquired from some Atari Dealers, +NEW in BOX 8 Bit Software as well as ST Software. And I'm about to add an Atari Collector's Collection to my stock, which I'm trading for one of my most prized Collectibles. All of it In very Good or Mint Condition. And thats just the Hardware! I still haven't seen the inventory of Software and Books/Reference Material!

Buy Atari Hardware and receive free Atari Software. Make me an offer on which Software you wan't. Offer is less likely with a cheaper Hardware Purchase. Please Redeem offers in E-Mail. First come, first serve.

I've switched ISP's! Try www.pacifier.com/~atari or atari@pacifier.com and as always www.atari.benjamin.net and atari@benjamin.net still work but are being redirected to my new ISP and since I've moved, I have revamped and updated my WebSite and all my WebPages. So Check it out and, If you don't come see me today, come see me Tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net while you Download Free Catalogs directly from my site. If you can't get my Catalogs that way, Feel free to Request catalogs by E-Mail. Really, it's not an inconvenience. I ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your full Mailing address so I can figure Shipping & Handling. I'll be back after the weekend. Bye!

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or atari@pacifier.com instead of NewsGroups as I
am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted.
So when you see a new posting, check my Catalogs. After I post this
message. I'm off for the weekend. But I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or
atari@pacifier.com. If you can't reach me at benjamin.net see my
E-Mail/Web info in my Signature at the Bottom!

Bravo Sierra Computers has Moved! To a New ISP! Now Hosted on pacifier.com!!! Atari 8 Bit,
ST and Jaguar Hardware/Accessories, Software/Games & References/
Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's
SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received
Through E-Mail at atari@pacifier.com or atari@benjamin.net and Please Specify Atari 8 Bit,

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Well,
Ataridsk from Hiassoft (Austria) does it. If you want to copy/download
an ATR image, just drop it into the dir/subdir of Ataridsk and voila,
you can now copy it to an Atari DD formatted disk (but therefore you
need a 5,25" Pc drive and a harddisk, since Ataridsk merely works with
5,25" and HD) ... -Andreas

Yeah,
I know these demos. they were programmed by Peter Sabath - the guy who
did the Atari version (conversion) of Activisions Shanghai. You can also
find these demos (and many others) at Sven Gleichs Atari Demo page...

Daniel Miller <DCM01@usa.net> wrote:
:>Out of curiousity, would using TurboBASIC be out of the question?

: I would love to know more about TurboBASIC. I noticed a lot of the
: Polish and Eastern Europeans who were doing the most advanced 8bit
: programming ever, like the 256 color mode and MOD players etc, were
: using TurboBASIC.

I don't think any MOD players were written in TBasic. :)
As for 256 colors, that's a DLI trick, and must be done in machine
language (so, if it's in BASIC, it's a USR() call). You can do this
in plain old BASIC, too.

: I have a 64k Atari 800 but I don't think it will run
: straight TurboBASIC which is for XL's and XE's. I found Turbo800 which
: is the watered down Turbo for 48k Atari's, but I haven't worked with
: it much yet.

Yeah, TurboBASIC XL uses the RAM "under the ROM", which allows it to
not only do a lot more, but also even have some extra spare RAM for
your program, compared to a regular BASIC cartridge.

: Another BASIC I bumped into was Frost BASIC, which also
: has something to do with Turbo.

Hmm... getting fuzzy. SOmeone else can help here :)

: I would be interested to know also about the compiler for TBASIC and
: if it requires a runtime module etc.

Yes, you need the RUNTIME.COM program to load your compiled file.
I think if you name your compiled TBASIC file "AUTORUN.CTB",
and the RUNTIME.COM file "AUTORUN.SYS" (or, in MyDOS, "RUNTIME.AR0"),
you can make a bootable disk which runs your compiled TBASIC program. :)

Cool, huh? :)

With all the internet games that have proven successful, Diablo, EQ, UO, and
the new ones coming out like Star Wars Online, it would be a natural for
Star Raiders Online to see the light of day.

For that matter, just a straight port of Star Raiders with player vs player
as an option would be kind neat.

I did download and try out 0.5. The new feature where the program letters your JPG's (A, B, C, etc) and you may then load them with a single keystroke is nice. I noticed that the program appears to check memory, because sometimes it will give me (64K Atari 800) the HIP modes as an option, and sometimes it won't. When I try the HIP modes I get poor results (flickers between one picture screen and one screen filled with static garbage). I guess this is because I don't have an XL. I am not sure if ANY HIP programs support 400/800 series.

Using ":" as a wildcard to get the directory listing is counter-intuitive and awkward. "*" should be used instead. Why not also automatically list the current drive directory when the program is started?

The best results for me are with GR. 15 and GR. 8. The GR. 9 modes are also very good. I would like a GR.9 option that automatically displays the center chunk of a bigger-than-visible-screen picture, and adjusts for the skinny pixels, so the image stays proportionate.

It is useful as a memory aid that the ">" indicates what mode you previously tried, in case you got a poor result and wish to try a different mode.

I was looking forward to the HIP modes, but I guess an XL or better is needed.

I ain't giving up my 800! It would be great if I could configure it to
emulate the XL RAM, since I have 64K. The 800 is an armor-plated
beast, and has twice the ROM sockets and joystick ports. I read
somewhere that there was right-side cartridge memory...

>Yes, you need the RUNTIME.COM program to load your compiled file.

Hmm, since Turbo is compatible with straight Atari BASIC, I suppose
you could do that with almost any program out there. I will have to
give that a try. I also want to get my mitts on the Datasoft BASIC
compiler if anyone has it. I have looked everywhere for the disk
image, no dice.

Andreas.
Thanks for Peter Sabath author of my favorite demos.
I've seen a fair number of demos, but these two are my favorites.
Got a url for Sven Gleich demo page?
I took them off a Compy Shop demo disk. Compy Shop is
Germany, as I guess Peter Sabath is.

There was a version of TurboBasic which did NOT use the RAM under the OS
(so it had less memory for programmes).

I believe Tom Hunt of Closer To Home (?) who was working on his
own Basic interpreter to be used with SpartaDos (which also uses
the RAM under the OS) ported the TurboBasic which did NOT use the
RAM under the OS to work with SpartaDos (3.2?) on an XL.

Having a 1450xl (short board) attached via a MUX to a 10 gig hard drive ...I'll say this .. it'll spoil you rotten. All the compatibility of the 800xl (as long as you don't need the PBI) but with that great 1200 style keyboard.

Why would you rather have the 1400? The 1450 did everything the 1400 was capable of, and added something (IMHO) really innovative, which was the floppy drive tied directly into the CPU's bus. Besides, the 1450 just looks really cool :) Oh well, I guess the closest I'll ever come to one is the cover of the june '83 MACE journal I have..

Don't get me wrong, I wasn't trying to contradict you, I thought
my text supported your argument. Since you correctly pointed out that
this all started on the C=64 I thought I'd add a bit more info to make
sure everyone got the credit they deserve, something I've made an
effort to do throughout the project.

>>But I do think that cooperation between the C=64 and the
>>Atari 8 (rather than arguments as in the past) are the way forward.
>You have proven that to be so... and you are thanked for that. I'd like to see
>a little more of what you have done. (I wish I could DO a little of what you
>have done !!)

Well if you follow both the C=64 and the Atari scenes then you're in a
great position to make contributions to both, and I think you've
already made some good contributions in this thread.

There are all sorts of things that people could do to help, for
example I've not seen many (if any) websites that encourage
cooperation between both systems. The ones that I've seen always
end up making a comparison somewhere between the two, and 'course,
one always end up being "better" than the other.

Source record: 38522

Does the manual for "Mini Office II" already exist in a digital form somewhere on the net?

Because if it doesn't, I'm gonna put it there :-)

I came across my copy of this great program package the other day, and was wondering if I should throw it out. Because I usually scan in stuff I want to keep a digital copy of, I tried to OCR it, just for the heck of it. And it works great! 99% recognition without even trying really hard.

So if nobody has it yet, I'm going ahead with this, just beacuse it works so nicely :-) I'll add some .GIF screenshots and will probably put it online somewhere, along with the .ATR

Oh yes, if you have never heard of Mini Office before, it was a great package, consisting of a Word Processor, a Database, Spreadsheet, Graphics system (really nice!), Communications and Label Printer. It was put to market a bit too late (1987), so it never really "took off", but it was very nice nonetheless.

So if anyone knows of a manual already, please let me know....

Richard Douwes

> XL. I am not sure if ANY HIP programs support 400/800 series.

That's a bug. It does check for 64K and only shows the flicker modes
(including HIP) if it finds it, but it only checks for XL/XE
compatible memory. Have you got any information on how your upgrade
works? If you can send me the info then I might be able to make it
recognise your upgrade too. The save to a HIP file option should work
in 48K though, so you could load those with a HIP viewer later.

I've got a HIP viewer that seems to support 400/800 machines (it works
with the Atari800 emulator in 48K mode). The file is called
HIPV11.COM, and the title says:
HIP VIEWER version 1.1
Written by MaYonez of COBRA

I can't remember where I downloaded it from now, but I found it by doing a
search on the 'net.

> Using ":" as a wildcard to get the directory listing is
> counter-intuitive and awkward. "*" should be used instead.
The problem with that scheme was that you couldn't use a wildcard to
load a file. So if you've got a file called something like:
a7zkui~2.jpg

Then you can't load it by typing 'a7*' for the filename. Although
that might not be such a big problem now. I guess it could be done
the other way around, wildcards without a ':' at the end means do a
directory, and with it means load the file.

> Why not
> also automatically list the current drive directory when the program
> is started?

Well I'm working towards that, the real problem with it right now is
that you can't step into a subdirectory from the directory listing,
and I can see someone complaining about that if it starts up that way

by default. But I am planning something with a more user friendly
interface in the future.

> The best results for me are with GR. 15 and GR. 8. The GR. 9 modes are
> also very good. I would like a GR.9 option that automatically displays
> the center chunk of a bigger-than-visible-screen picture, and adjusts
> for the skinny pixels, so the image stays proportionate.

I think the centering is a great idea. I almost put it in for this
version after you suggested it for the slideshow. It will get put in
for the next version. I was thinking of having an option for it when
you choose the row and column offset. So have it default to something
like 'C' meaning centre instead of '0' like it is now, but allowing
you to change it to something else if you want to.

The skinny pixels are a problem though, the GR.9 1/1 mode will do it,
but only by averaging the pixels horizontaly and doubling them
vertically, which doesn't look great. The GR.9 2/1 mode is a bit better but
not perfect. I've got an algorithm that might do a better job
but I've not had a chance to try it yet.

Thanks for the feedback,

You're right, DataSoft was aka MMG and ABC ~Monarch?

I actually have the MMG compiler, it was pretty good. I think I ran into a problem with it, runtime library loaded to low to be used with other device handlers loaded or something.

Disks have gone south now, but it had both single and double densisty versions as well as supporting two drives, ~360k available for program and work files.

> The ABC Compiler is the third result if you search for "BASIC." I
> think that is the Datasoft one? So far it just seems to crash...

No, the ABC is from "Monarch Data Systems". It's not a real compiler,
though, it compiles programs into pseudo-code that gets interpreted
by a run-time library. It also supports integer arithmetic only.
The TurboBasic compiler really compiles programs into machine-code,
so does the MMB (sp?) compiler.

Nevertheless, ABC has been widely used. Lots of MicroProse products
have been written partially in Basic and were then compiled with the
ABC (Solo Flight, F-15 Strike Eagle), also some other programs
(Highway Duel, Cavelord). Actually, the compiler itself is in Basic
and compiled by itself. (-; Not a very smart compiler, if I may add this
remark. No optimizations whatsoever. The TurboBasic compiler is much
better in this respect.

So long,
Thomas

>You're right, DataSoft was aka MMG and ABC ~Monarch?<

In about 1983 both DataSoft and Monarch Data Systems released BASIC compilers. Datasoft's was evidently produced by an entity known as "Special Software Systems" and licensed to DS which published it. I never liked that compiler very much -- IMO it was difficult to use, and had lots of restrictions, but it did produce ML files, while ABC produced P-code. Several years later, MMG published the MMG Compiler which again was licensed from "Special Software Systems". This was definitely an improved version. Still operated the same way, but was "less fussy". It's unfortunate, I think, that ABC can't be updated to handle Turbo Basic. The reason being, is that ABC produces *very compact* stand-alone programs. Analog mag. published a comparison of the DataSoft Compiler and ABC in issue 11, pgs. 59-65.

Raph originally pitched "Privateer" to Origin and they balked at doing it. Then he jumped to Verant/Sony and the SWO project. I have to plead complete ignorance here, I have never played Privateer so I don't know what game elements he is looking for adding. Any Privateer players in the newsgroup?
>
> Love to see Star Raiders do that.

There were elements in SR that I found really compelling on a gut level. I still remember how well it simulated the vastness of space. You would come out of hyperwarp after a bad jump and it would seem like it took forever to get to your base that was under attack.

Losing your sub space radio, navigation computer, made you feel blinded or vunerable.

Thanks! And because of this encouragement (sp?), I've also added the
"Graphics" section tonight. I almost forgot all about this part, but what a
great little program this "Graphics" was! Even had a "graphical user
interface" :-) (At least partly...)

So now there's 4 sections to go.... (Database, Spreadsheet, Comms, Labels)

The version number is stored at $B000. To get it:

1) boot up with the Action cart
2) ctrl+shift+M (goes to the monitor)
3) then type
? $B000
and press Return
The hex number on the right contains the version number as the last two digits.

If you so this, please post results. I have 3.5 (orange case) and 3.6 (black case). Any 3.3, 3.4 or 3.7 versions out there ?

3.5 and 3.6

Was the revision change to 3.7 by FTE?

I'm pretty sure there were no significant changes. Only difference was
Action! prior to FTE defaulted to using the DOS INIT vectors so you could
write things like appendable device handlers but was slightly incompatible
with SD. Last version just switched to RUN vector which means better SD
compatibility

Eleven! That has to go back around early '83 or late '82; surely there is something on the compilers a little more recent. Mine only go back to #13 and I don't personally know anyone with issues before that except Mike Beard who kept Nos. 1 & 2 in plastic bags and never opened them for anybody.

Perfectly acceptable... I added the link for reference for others to "explore" !!!

>>(I wish I could DO a little of what you have done !!)
>
>Well if you follow both the C=64 and the Atari scenes then you're in a
>great position to make contributions to both, and I think you've
>already made some good contributions in this thread.

I wish I had the time I had when I was younger to sit and code (if what i did could be called "code") to make some "real" contributions but I now have a family, run a construction business, maintain a few commercial websites and play in a band... so time is not something I have a lot of in my life, right now... what I can offer is mostly, just information.

>There are all sorts of things that people could do to help, for
>example I've not seen many (if any) websites that encourage
>cooperation between both systems.

I did joking say that I can see my C64 website now becoming an ATARI/C64 website... but alas... I have run out of space before I have run out of HTML !!!

Let me offer this and see what everyone thinks of it... I haven't tried this but I did discuss this in another group a while back... someone was experimenting with this exact thing.. of course I had to say "it's been done... on a Commodore" !!!! (This was recommend in COMP.SYS.CBM as a way to get your first "simple" file transfer because it was written in BASIC and could be typed in... once you got it working then you could go out and grab more sophisticated software).

I have on my web site (http://members.aol.com/fyarra001) a transfer program written in BASIC with embedded M/L data statements that uses the C64 SID (sound) chip to do cross-platform file transfers (only one way at this point)... anyone think this is possible on an ATARI ??? Can it be made to work from a PC to an ATARI ???

Here are a few excerpts...

==========
"To transfer files from a C-64/1541 to a PC, many users use the X1541 cable."...

"Two other methods come to mind. One is a modem-to-modem connection; the other is using a null modem adapter and a connection to the PC's serial port."...

"This article offers another option,
which requires soldering only two wires, and probably no more than a 35-cent financial investment. SID (either a 6581 or an 8580 IC) is used as an FSK (Frequency-Shift Keying) generator at 300 baud, in accordance with the Bell 103 standard. Only simplex operation is supported, so the direction is only from C-64 to other computer. Also, since the Xmodem routine is "open-loop" (the C-64 ignores ACK's and NAK's, delays are used between blocks.
Xmodem-CRC is used, since most terminal programs initiate downloads expecting that form of Xmodem."

"The hardware consists of a length of telephone cable with a modular plug on one end and an RCA phono jack on the other."
==========

Well... hope someone finds this interesting enough to experiment... sorry if it was a little lengthy... :)

Date: 2001-02-26 04:33:50 UTC
From: Bob Ryan <ryanr@one.net>
Message-ID: <3A99DCAE.D9F0077C@one.net>
Source record: 38352

Here's my results:

1. Black Cart/Yellow label with (c) 1984 on label:

45056, $B000 = 6 $1036 54 310

2. Orange Cart/Yellow label no dates:

45056, $B000 = 5 $1035 53 4149

3. Black Cart/Yellow label (BASIC XE) that has Action!, BASIC XE &
MAC65:

45056, $B000 = 6 $1036 54 310

I checked the orange cart twice in an 800 and a couple of times in a
130XE. Same results. Anyone else have an orange cart with the same
numbers?

For those wondering, the last cartridge listed is a BASIC XE cart that
has been modified to also have Action! and MAC65. There's a three
position switch on the top to select the program to run. I bought it
from James King many, many years ago.

Techtv.com says Atari (they don't even pick a particular model, they
simply complain about everything from the Atari 400 to the ST)
is 7th crappiest computer in history.

I now have a new mortal emeny.

By the way. The C64, Apple //, TI-99, and TRS-80 also made the list.
Apparently computing was supposed to jump straight from the abacus to
1 GhZ Windows 2000 machines overnight.

What a bunch of dickheads. I haven't read so much uninformed overopinionated crap in my life. Period. It is a pity we can't get this bunch of morons to stop upgrading for a minute, check their history books, and realise they are only running fast 8bit dos box's. I would love to sneak in there and remove their hard drives replace their 1.44's with 5 and a quarters, and put mono graphics cards in their PC's. Far as I can see anything with windows on it should be considered a joke.......

Mark

"I used to use an Atari 800XL and Packard Hell 486DX2-50. Both were really
worthless boat anchors." -- Sam Alexander

"My worst is an Atari 1040ST that I traded for some motorcycle parts"-- Ted
Beers

"I was the proud owner of an Atari 400. Oh how I miss that membrane keyboard
-- keyboard without keys, what a wonderful idea. Or loading programs from a

cassette tape. What a stress reliever to be able to go out, have a nice dinner and take in a movie, and come back and finally have that program almost loaded.

To prove we don't learn quickly I also bought the Atari 1200XL. I believe the XL stood for eXtreme Loser." -- Chuck Smith, Sardinia, Ohio

"The Atari 1200XL should probably be on the "crappy computer" list as well. Even though it had a full-stroke keyboard, it was the first Atari computer to feature a "closed architecture" design, as opposed to the plug-in RAM and ROM modules on the Atari 800. Atari enthusiasts shunned the machine, and it died a quick, painful death.

I personally think that the entire Atari line belongs on the "Crappy Computer" list for one reason -- those blocky player-missile graphics! If you can ever get your hands on a copy of the Atari version of Ghostbusters, try and play the game to the conclusion. During the climax you're trying to get past the Marshamallow Man without getting squashed." -- William Hicks

just thought I'd post the whole atari shootdown fest.....

There were some legitimate gripes in there. Apparently one guy had a membrane keyboard Atari 400. Other complaints ranged from slow cassette to a stock 1200XL. I like the 1200XL best of all my Ataris, but I don't use a stock one. Memory expansion, multiple OS, built in BASIC, that kind of stuff.

** PhillyClassic 2001, The East Coast Classic Gamer's Event! **
** http://www.phillyclassic.com **

** UPDATE: 02.26.2001 **

Even though we are officially SOLD OUT of table space, we
still want to encourage as many people as possible to bring
items for sale and trade. Towards that end, the PhillyClassic
staff is pleased to announce The PhillyClassic Trading Post.
The Trading Post will be available throughout the show for
attendees to bring in items from their vehicles or hotel rooms
once a deal is under negotiation, to inspect the goods, lay things
out, etc. These tables are NOT to be used for displaying items to
the public, but simply for buyer-to-seller inspections and
transfers. Once a deal has been closed or declined, the table must
be cleared. In this way, everyone will have a chance to sell and
trade their goodies, even if they missed the chance for a permanent
display table.We wish everyone happy hunting at PhillyClassic 2001.

Hozer Video Games has graciously donated *5* Atari 2600 Thrust
carts and Good Deal Games has also donated a copy each of their
new Sega CD games, Bug Blasters and Star Strike. Thanks to Hozer
and Good Deal Games!

In addition to their donated games, Hozer and Good Deal Games
have sent us carts to sell at PhillyClassic. Good Deal Games is
offering a special $29.99 price for their Sega CD games, a $5 show
discount plus NO SHIPPING! And Hozer will be sending a nice
assortment of homebrew 2600 games for us to demo and sell at
PhillyClassic!

** UPDATE: 02.04.2001 **

Tables are now * SOLD OUT *. Thanks to everyone who purchased one.
Just because you can't get a table doesn't mean you
shouldn't come! Be sure to attend and check out all sorts of
cool classic games!

The t-shirts are almost done and are going to go to the printer
soon! We think they look really cool!

The tournament list has been added to the PhillyClassic website!
Games range from the 2600 up to the Playstation 2! Each tournament
will be accompanied by a great prize package thanks to all our
sponsors!!

** UPDATE: 01.31.2001 **

Table spaces are becoming EXTREMELY limited so if you're planning on attending and are debating getting a table, MAKE YOUR DECISION SOON! :)

Randy Femrite is going to bring down all sorts of neat Jaguar items to show off like a Jaguar Rotary Controller, Battlesphere, Skyhammer, and a XE/Jag controller interface!

** UPDATE: 01.22.2001 **

Hasbro has sent us a lot of games to be given away at the convention! Thanks Hasbro!

Michael Roberts has donated a TON of Star Wars handheld games for us to give away at PhillyClassic. Thanks Michael!!

** UPDATE: 01.10.2001 **

Digital Press has graciously donated MANY Digital Press 6 guides to be given away at PhillyClassic! Thanks Joe and everyone else at DIGITAL PRESS!

We rented another 1000sq ft room for the convention, bringing the total up to 3000 square feet!!

More and more sponsors are contacting us EVERY DAY meaning more chances for everyone to leave PhillyClassic 2001 with a GREAT prize!

Classic Gaming Expo and PhillyClassic have teamed up to bring you the best gaming experience you can get on the east coast!

John Hardie and Sean Kelly are graciously donating items for us to give away at the convention. When you hear the names Hardie and Kelly, you know they've gotta be good!

Ticket prices are currently $6 in advance, and $7.50 at the door. Tables to setup your goodies on are $10 per table. Tickets will be on preorder until March 30th, 2001. Just remember, we're a non-profit event, every cent we make on PhillyClassic goes right back into the convention!

This year's tickets are pretty nifty! Marc has made Intellivision carts into our tickets that hang from you neck! Really neat!

** UPDATE: 12.23.2000 **

Sponsors are pouring in, which means more chances for everyone to walk away from the convention with a great FREE item!!

T-shirts will soon be available for pre-order. These spiffy shirts feature the PhillyClassic logo and some classic game logos! Be sure to put an order in as soon as they're available!

Randy Crihfield of Hozer Video Games has donated some new
Atari 2600 games to be given away! Thanks Randy!

Jeff Folejewski will be bringing MANY (as in more than 5) full-size
coin-op arcade games! All games will be set on free-play and a
tournament will be held on his Joust machine!

Good Deal Games has also chosen to donate some of their new Sega
CD games to be given away at PhillyClassic! Thanks Good Deal
Games!!

** UPDATE: 10.30.2000 **

Van Burnham, editor of Wired magazine and author of Supercade
(www.supercade.com) has confirmed she will be attending
PhillyClassic! She's a great video game buff and a wonderful
person to talk to!

Be sure to bring all your spare games and systems, we will be
holding another auction this year! Last year people who auctioned
items off made a LOT of money, and it's a good way to part out
some of the extra items you don't need!

** UPDATE: 10.15.2000 **

Chad Schell of Schell's Electronics has donated an Intellicart
to be given away as a prize at PhillyClassic!! Thanks Chad!

Tickets for PhillyClassic are now on sale!! The price for admission
is $6 for both days, and $10 per table you wish to use to setup on.
Just remember, any money taken in from the attendees is not used
as profit for any of the organizers; it's used to pay for everything
used to setup the event. In case of any spill over money it will be
used towards next years event!!

If you have any items in particular you're wanting to pick up or to
part with, be sure to e-mail Jeff Folejewski and let him know so he
can add your list to our PhillyClassic webpage!

** INITIAL POST: 9.26.2000 **

David Newman, Chuck Whitby, Marc Pallante, and Jeff Folejewski
are proud to present PhillyClassic 2001!! The first
PhillyClassic was such a success we had no choice but to do it again!
This year's event promises to be nothing but BIGGER and BETTER!

Website is now up and LIVE, complete with:
* Information/scheduled events
* Hotel accomodation info/online reservations
* Driving directions and interactive maps
* Ticket information
* How To Link to Us banners/ads available for
YOUR classic game related site!

The weekend of April 20th and 21st will be one to remember as classic
gamers unite for a weekend of hardcore gaming!

Planned events include casual trading/selling, *tournaments*,
auction, show-and-tell, a guest speaker or two, and a
general good time by all!

We have rented a 2000! sq ft conference room at the Sheraton
Suites for the event, which means enough room for a lot of
people to come and setup the pride and joy of their collections,
and even a little tradebait!

The tentative times are as follows:

Friday: 5pm - ?? -- First Day, Setup, Meet and Greet, Informal
Trading and Game Playing
Saturday: 9am - 5:00pm -- MAIN DAY

If you have any questions about the event, PLEASE e-mail:
David Newman (davidnewman@adelphia.net)
Chuck Whitby (intv-sama@worldnet.att.net)
Jeff Folejewski (adventurevision@yahoo.com)
Marc Pallante (marc@classicgamer.net)

If you plan on attending, please
purchase your tickets early and make those hotel reservations!

Thank you very much!

I like the Indian dude who says his old Gateway is crappy 'cause he
downloaded three viruses on it! I think that the Gateway, Micron, TX
Instr.(only because of it's initial $1000- price tag), and Packy Bell all
absolutley belong there! YEAH! I find it interesting that most of the
complaints do seem somewhat educated and informed, almost as if they read
this newsgroup. I think we may have traiters in our midst!

well i suppose the real crud of the 8 bit days have realy been forgotten.

Matel Aquarius anyone? out dated, over priced and under spec when it
arrived. No one bought them. Now shifting for £150 mint in box!

Sword M5, same issues.

I mean if your going to release a rubber keyboarded sub 16k ram machine,
don't do so when the spectrum 48k and C64 are long established and involved
in a price war :)

Over here in the UK you had the C64, Sinclair Spectrum, Amstrad CPC,
Acorn/BBC and Atari here in the UK. All else failed. Even then Atari thought
was always a bubbler, struggling to hold on to 4th or 5th position.

You should have seen some of the other pretenders, Brave tries like the
oric, or mythical beasties like the enterprise/whatever they called it in
the end, through to jokes like the aquarius! Now there was real crud :)

Looks like pretty much every major computer maker made the list (Dell is
absent).

Take heart -- Atari can't "win" this, simply because of the numbers involved.

I've given up fighting a long time ago. People can get used to anything and believe they like it, even when somebody shows them something else that has clear advantages over what they're using. That's human nature.

I saw multiple advantages in Atari 8-bits over what else was being offered at the time. In those days, an OS and a particular hardware design were much more closely linked, so you did get used to one machine or another and found that the others were clumsy to work with.

I kept a very open mind when I was issued an Apple //c (and later a Mac) to schlep around to my homebound students. I also kept an open mind when I went into a student's house to teach him computer math, BASIC, or applications and found that the student owned a C= or a PC Junior or one of many other machines. I tried to learn as much as I needed to know to enable the student to use those machines to do the coursework. But the advantages of the Atari 8-bits over them were always clear in my mind when certain tasks came up, particularly when I was given a PC for the summer so that I could develop lesson plans for a curriculum manual that never got published.

Atari 8-bits should have been the clear choice for school districts. Atari never saw the need to push into that area. People are just as swayed by marketing campaigns as they are by what they get used to. The marketing campaign may, indeed, govern their choice in the first place. Brand loyalty as the result of a catchy jingle? Don't laugh -- it's been true too often.

Well said, Alan! Very well said....

Look at me... I'm a victim of Microsoft products - whether I love them or not! It's a good thing I have 128meg memory and a 20G Hard Drive! Meanwhile, it's almost 20 years and you and I are still typing to each other!!!!

Funny how we used to do the very same thing we're doing right now using a 32k Atari 400, 300 baud modem, and the trusty old 810! (at Fordham!)

Wheeeeeeeeeeeeeeeeeeeeeee!!!!!!!!!!!!!!!!!!

Ok, if you search the index of Digital Antic, there are 2 reviews of ABC and
the DataSoft compiler in May, 1983. Check out:

http://www.atarimagazines.com/v2n2/productreviews.html

There is also a review of the Advan Basic Compiler in April of 1986 in Antic.
That's all I know of.

The problem with this particular 'poll' is that by definition it will
attract the biggest complainers. It's _designed_ to lure all those
morons who have utterly no computer savvy to go and complain about the
machines they once owned. I'd be willing to wager that if they'd come
out with the 10 best computers, you'd see some of the same names on
that list, 'cos everyone has their own personal opinion and slant on
the various machines that have been available throughout the years.
Put up a 10 best list and I'd bet you'd have plenty of Commodore and
Atari faithfuls who'd come round and push it up near the top, so
really, that 10 worst list is utterly no indication of which machine
was really worse, 'cos it's completely subjective.

Okay, _no_one_ will probably ever admit that Compaq computers were
ever good, but that's a given. :-)

The problem is, they're comparing particular MODELS of computers to entire COMPANIES.. And they're not even limiting it to a particular era! That would be like saying "Yeah, my model T sucked.. no On-star, no in-dash radio.. My new Escalade is so much better!"

Oh well, I'm used to nut getting any respect. I have a Vega in the garage :)

This is poll from users, on a TV show geared at PC users.
I've seen the show, it's moronic to even get worked up about it.
Ignore it.

Well said. The thing forgotten here is to devide the number of complaints by
the number of the computer sold. For 'Atari' you will have to add up all
different specimen of Atari ever sold. Then it will undoubtly rival the
Commodore for the first place of the least crappiets computer in history.

I kind of liked the theory one computer wag put out; "Any computer that could use a cassette for storage, and that includes the original IBM PC".

That was almost a valid argument. Modern age of computers didn't come about until the Amiga, Mac, PC/AT, ST.

It looks like the 4th and 5th numbers, the two at the end of
the $xxxx are the version, not the last two? So 3.6 would be
45056, $B000 = 6 $1036 54 310 would be 3.6?
Gene said 'the hex number on the right', so I guess he means the
$xxxx number. I thought all were hex numbers and he meant the
last two digits. I think I answered my own question.

<mindfield@badgers.emulationnet.com> grabbed chalk and scrawled:
>Okay, the bolted-on joystick was a really stupid
>idea ... but it still _looked_ cool. :-)

Actually, it was a great idea for text editing :) It was very fast, and
light.

For games, most of the time you used a tiny adaptor and an Atari
joystick :)

Richard (there were few native games, though. Most were Spectrum ports,
sometimes with new music 'Nodes of Yesod' being a great tune with a
typical Spectrum game. There was a /great/ trailblazer clone, which on
the 128 used shaded graphics and wouldn't have looked out of place
running on an Amiga).

For worst computers a lot of theose brands had some major market
share. I beleive I saw in an old copy of Family Computing I have from
the early 80's that Commodore owned 40% of the PC market around
1982-83 with Apple at second with 30% and Atari boasting at least
double digits itself in market share.

Seems that they sold a whole lot of these "horrible" computers. ;-)

I think you are all sore loosers when it comes to crap machines. ;o)
Y
ou should ask anyone who lived in the 80's behind the iron curtain or at least in other socialistic country, like former YU or similar.
With import constraints protecting domestic NON-EXISTENT computer industry,
any of the bigger manufacturers who even considered a possibility of soldering a few resistors was suddenly "computer manufacturer".
It was not important if the thing actually works, all that mattered then was to have some box at the fares...
So, in order to be able to byu something with 8 Kb RAM, monochrome and self-compatible, one was forced to pay 2-3 times price of C64 or over 5 Spectrums 48K. As an insult to the injury, all those machines bared names of partisan heros (WW II stuff).

OTOH, like through all prohibitions, people were boiling mean stuff literally at home. I remember scraping the money from all my relatives just to be able to byu components for "Galaxy" (very cool model in ZX-81 class, but with no-nonsense keyboard, ingeniously small basic and MANY very effective expansions- all with complete schematics and 100% homebrewable, it some kind of was our local GPL licence). You would not believe it, but author says that over 30.000 PCB's were sold to people in very short time !
Other from many serious contenders was "Wolf", which was in QL class, only simpler, with intergrated Pascal compiler instead of SuperBasic, with better graphics and much faster. Interestingly enough, author had even developed PCB CAD software that ran on "Wolf" and with which later models were developed.
There were several very nice CP/M machines, even one with HD64180...

To be 100% honest, there were RARE exceptions even between bigger local names.

One of them (and IMHO ONLY) was our "Iskra", which had developed multi CPU modular VME machine (68000/68010, 80286 and later 386, I don't remember the 3rd CPU option, I think it was some VAX relative).
With serious graphics at that time (256 colours at 1k x 1k with graphics&math cop. for starters) it was something to drool on- i think it was y.82....

I still have in the cellar some color VGA class monitors, that were specially meant to be used on remote terminals on the machine full VGA graphic just for remote terminal wasn't half bad in y.82... Did I happened to mention that one of CPU's supported Unix ? Monitors were from Toshiba,

but housings were/are ultracool, since they were made somewhere in Italy
from special plastic that gave them distinct look and every other part on
the computer was from same material...

I'm persuading one of the monitors these days to work on my to-be-heavilly
rearanged QL with VGA output. After all those years in the cellar it still
looks and works as new...

Regards,

Branko

To import is simple. Just click on the disk name and it's contents comes
up. Now you can delete export or import files. To import a file just drag
it from the ST desktop to the GEM box showing the contents of the DI disk.
Works great on my Hades 060 too.

I still don't know how only 3% gets atari in to 7th place. Since I have a bunch of those ol' systems I have to say the sinclar ZX81 is the crappiest but I still like playing with it. And as far as there Tandy/trs80 sounds pretty grey to me. I still use my M100 still to this day, and my 2500 SX and my 1000 tx. Can't be that crappy if there still being used. Mind you, you do get used to the membrain keyboard on the 400. And that was only used on the 400 because it was a starter system as little kids tend to have messy fingers.

Don't know many people back then that could afford a 5 meg HD and about 5
grand each. and anybody remember how much the 810 and 1050 cost when they
first came out? Cassettes sure beat having to retype programs every time
you wanted to do something.

Does anyone know where (or if) I can find an online copy of the Atari Technical Reference Notes? I've found lots of other stuff around, including scans of the Hardware Manual and the ANTIC/POKEY/GTIA chip references, so I presume that the legal issues are more or less ignored by whoever has the Atari IP rights now. But I can't find the Reference Notes (or OS Source Code, but that's less important right now) anywere.

I've recently gotten back into the 8 bit world, and am really kickin myself for throwing all my stuff out years ago. What I'd give to have this book back.

That's quite interesting. Like just about everyone today, I own powerful PC, but my BEST years of computing were spent during the Atari period -- from the 400-800 series. They've got to be absolutely ill informed to post that info.

<atari.h.wessels@atari.home.nl> drooled an embarassing wet spot in his
lap as he typed:

>Well said. The thing forgotten here is to devide the number of complaints by
>the number of the computer sold. For 'Atari' you will have to add up all
>different specimen of Atari ever sold. Then it will undoubtly rival the
>Commodore for the first place of the least crappiets computer in history.

Undoubtedly. When you aim a particular poll with a particular slant
at a particular crowd, you're obviously going to come out with a great
deal of response that favours the poll's slant, because that's what
they want, that's the demographic it's aimed at, and those are the
people that are going to do the voting. I could put up a poll asking
after the 10 worst Bond movies and get loads of response, in spite of
the fact that everyone knows that, by definition, there really _are_
no "bad" Bond movies; only ones that were better than others. It all
depends on what end of the scale you put the labels on.

A good way to look at that list, I think, is to take it, flip it
upside-down, and re-label it "10 best computers" ... that'd put Atari
at #3 which, if based on the market share that each computer commanded
during its reign, would be just about right. :-)

Granted, more common machines were much more expensive behind the
former iron curtain, but that's mainly because of government
regulations and policies regarding imported products. The former USSR
for example, was particularily strict on the importation of products,
applying massive levies to them to discourage people from buying
foriegn products and instead encouraging domestic purchases. After
all, communism was all about the people working for the betterment of
everyone, and wasn't too keen on the capitalist view of working for
the betterment of oneself.

Well, it's sort of hard to include homebrew and extremely obscure
machines to that list because they were very much indigenous to a
particular, narrow region. Chances are, few if any who never lived
behind the former iron curtain have ever even heard of such machines.
The Sord M5, for example, was generally a machine found only in
France. The Panasonic X68000 was a Japanese machine. And I think the
only reason more people know about them now is because of emulation.
Heck, I think there are a lot of computers people would never have
known about had there been no emulators around to allow us to see and
play around with 'em. :-)

I've got the pages scanned as JPEGs. Warning: they are large. Page 1 is
almost 600K and page 2 is almost 800K.

The URL for the individual pages is:

http://cerebro.cs.xu.edu~ryanr/atari.html

the link for the article is at the bottom of the page.

For those that prefer to download a ZIP file, try this:

http://cerebro.cs.xu.edu/~ryanr/atari/compute.compute.zip

the ZIP file is almost 1.4 meg. in size.

I sized the images for readbility. If people find them too large to
download, let me know and I will reduce the size.

1475. Intex-Talker Voice synthesizer

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-27 09:14:14 UTC
From: chainsaw11 <mygranny@swbell.net>
Message-ID: <L8Im6.172$K57.212849@nnrp2.sbc.net>
Source record: 38298

I got a hold of an 'Intex-Talker' voice synth box from a guy who had used it years back on an atari 400. He said it used BASIC commands without special software,but that's all he remembers. I can't figure it out, It uses a rs232 jack on the back with a homebrew adapter cable that is supposed to plug into the joystick port. The board inside says Micromint text to speech with two speech chips one high and one low. It also has jumpers by the rs232 that are both marked DTE and DCE- set opposite from each other. There is also an 8pin DIP switch with the first six set low and the last two set high. Everything says copyright 1982 Micromint. Does anyone have a clue how to work this thing or set it up right? Thanks,
Mo

1476. DI files support

Newsgroup: comp.sys.atari.8bit
Date: 2001-02-27 10:09:05 UTC

Hi!

The *.DI files support was added to my utilities ACVT (converter), ADIR (files extractor) and BAS2BOOT (basic -> boot disk converter).

The support is incomplete and very probably buggy. The full description of the format is needed. Does any of the ST users know authors of XL/ST-link or XLDJ?

The partial format description was also added to my site.

I've owned my share of Atari computers, Amiga computers, and self-built PC's, and I can still say without a doubt that the tie for worst computers ever is Compaq and Packard Bell (RIP, you suckas). No, I have never owned either brand, but having worked in computer service/support/sales for four years, I have seen more people victimized by these two types of computers more than any others (IBM's, Gateways, and relative newcomer E-Machines are close in the running, though). Something I am quite thankful for is that I am old enough to have grown up using TRS-80's at school before getting an Atari 800XL for home use. I have/had no doubt that Amigas were the best computer on the market in the late 80's/early 90's. Now that we're in the age of mega PC's (of which I own two), it really makes me appreciate what we had back then. Those $400 disk drives were tough on the pocket book, but it you were DAMN glad to have them. Nowadays, I like to laugh at people who complain about 500 Mhz machines being too slow. Not to be cruel, but just to find it amusing how "spoiled" people are today. I suspect that the idiots who came up with this poll

As far as ARO goes, does ANYONE know who owns the rights to Alternate Reality right now? I e-mailed Mr. Price over two years ago but didn't get a response. I ask because I would love to bring to fruition a media project I have been working on since the 1990's involving AR. Yeah yeah, probably just a pipe dream, but I want to do more with my life than tell people that their 386 Packard Bell has finally given up the ghost, or that their IBM PS/2 can't handle the DVD-Rom drive they just bought their son.

Hello, Bob.

I just downloaded the files. Thank you! I'll try them out in a couple of
days with TBXL.
I wonder what kind of program would be most worthy of that extra memory.
Preferably something fun, something that could not be done with a RAMdisk.

>Techtv.com says Atari (they don't even pick a particular model, they
>simply complain about everything from the Atari 400 to the ST)
>is 7th crappiest computer in history.

Well, FWIW, it's TechTV's site visitors that named these computers "crappiest." And I wouldn't expect many of them to even remember Atari. Indeed, I well expect most will hear of an Atari for the first time, compare 32k to 512 megs of RAM, and think that's "crappy." Of course, they don't understand how much RAM that actually was. How can we expect them to understand that it can be enough!

>By the way. The C64, Apple //, TI-99, and TRS-80 also made the list.
>Apparently computing was supposed to jump straight from the abacus to
>1 GhZ Windows 2000 machines overnight.

Also FWIW, the number one "crappiest" is the "Compaq Presario," which is a HUGE swath of a desktops, laptops, and low-end office PCs and they _all_ run either Win 98, ME, or 2k. I think that's the funniest part of the whole poll.

It seems to me that this says more about the ignorance of TechTV's audience than the "crap" quality of the particular computers noted.

And this is an excellent point. What about using all those punch cards to
enter in data? Or computers that had no such thing as a BIOS or a built-in
programming language. Eek! Run!

>know he ever intended on continuing and/or re-releasing the games. Has
>anybody tried e-mailing him? Maybe he'd post an "update" on this NG if
>asked!

He was working on Alternate REality Online a while back. He had a
website up that featured screenshots from the Work in Progress, and it
looked quite nice, though I think it probably had lost a lot of its
uniqueness in the morass of first-person shooters and RPGs, since it
looked much the same. Still, it was an AR title, and AR being my
favourite title of all time would have commanded my full attention.
:-) Unfortunately, Phil wasn't able to garner the rights to use the
AR name and storyline, so the project, sadly, was scrapped. Pity...

I haven't really given the Enterprise emulators a proper chance yet.
I'll have to drag it out and take a good look at it. I did like
Trailblazer, so wouldn't mind taking a look at this clone, and
Nodes/Arc of Yesod were pretty cool Speccy games.

As I said I hadn't really given the Enterprise emulators a chance yet,
so I'm going to have to drag it out and play around with it. Get a
sort of second-hand experience of what the Enterprise was all about.
If it played as well as it looked, I can't imagine why it didn't take
off.

Very profound. People like what they have grown familiar with, and with
adapt that if need be before jumping ship. In truth, small changes are better
than large ones. Probably why you see people continue to upgrade Atari 8-bit
machines. Not only the desire to use something familiar but see something that
is familiar do more. :)

Best way to look at this for now until the unscheduled (possibly unlikely) day a straight out ATR <--> DI converter is made is to look at the 800XLDJ setup like a standard drive. Boot the Atari 8-bit up with the 800XLDJ setup, and then work within the Atari DOS environment (or whatever you use for disk operating system) much like you would with any Atari drive. Right now you have to work from the Atari side of things rather than converting files and importing things from the ST side.

Like I've said before, not as developed as Steve Tucker's APE software, but a great way to have 8 -1 meg virtual drives to use (without as many power supplies and wirey mess that 8 1050 drives would be...) (grin)

That's true, but at least this one's somewhat more generic in that it uses the rs232 style along with some sort of card edge connector. The other voice box I have for my TRS-80 is very narrow minded in that it only uses the system bus of a TRS-80 model I, no it doesn't work either. But thats another newsgroup. ;-)

I got a pretty good scoop of info from the tandy newsgroup, Dave found a webpage devoted to the unit as well as others
http://web.inter.nl.net/hcc/davies/txtospin.html

Alot of info there but still no idea of the pin switch settings, apparently this unit could be set up to act like a modem. The cardedge connect is a parallel interface.

Well,
there are even 2 versions of Turbo-Basic for 400/800 computers avaiable.
One was programmed by famous Frank Ostrowski himself, it is called Turbo
Basic (not Turbo Basic XL!). The other one is called Turbo Basic 3.2q
and was done by Tom Hunt especially for sparta DOs users... I guess
both versions had less RAM (maybe 20 to 24kbyte of RAM instead of
34kbytes) and missed the BRUN and BLOAD statements. The other
differences are unknown to me... -Andreas

Well,
but whats a double-sided floppy worth, if you do not have the floppy
controller board ??? Without this board you cannot use the floppy and
besides, the floppy is double-sided, but still medium/dual/enhanced
density. So you would need an upgrade to use 180k or even 360kbytes.

Message-ID: <3a9d96c5$0$1518$53a6afc1@news.erinet.com>
Source record: 38329

Hello.
Thanks, eric gave the URL. I can't remember them either.
eric gave it so all I had to do was click on it and then add it
to my favorites list.
I looked at the site, the demos area, but didn't download anything.
I've seen some demos, it is just that these two by Peter Sabath are
my favorites, especially the color one with 'house of the rising sun' music.
Some demos are fantastic graphics. The AR Songs demo of songs
from AR, the Dungeon, is probably the best music one. But the
music and graphics of the one I'm talking about is almost hypnotic to
watch and listen.
If you or someone else has a candidate for best music and graphics
demo, I'd probably take a look at it.
As it happens, I have a copy of Tom Hunt's CTH archive, which
has hundreds of demos, so I probably have most demos, if you
want to mention one worth a look.

Howdy *.*!

My problem: The 130XE gives a real shitty picture. Vertical stripes,
especally in green or blue background.

What can I do? Is there a way to fix this *very bad* tv out?

I've tested the XE with my C1084s with seperate chroma/luma ... and
normaly, this would give the best picture quality it look still
lousy...

HELP, ATARIANS, HELP!

I do not think those were screenshots from an actual work-in-progress.
Those were just electronic drawings, mockups of what the game might
look like, by some artist.

There is also MP3 music at the ARO site, but it just sounded like
gibberish when I tried to play it. There may be some fakery going on.

>looked quite nice, though I think it probably had lost a lot of its
>uniqueness in the morass of first-person shooters and RPGs, since it

>favourite title of all time would have commanded my full attention.
>:-) Unfortunately, Phil wasn't able to garner the rights to use the
>AR name and storyline, so the project, sadly, was scrapped. Pity...

What I thought would be a good idea to do, to cut and paste the actual
AR 8bit AR graphics and map into a Doom WAD file, or some other modern
3D game customization file. I think this would be an interesting
initial step that wouldn't require too much effor.t

> Thanks!

The most likely problem is excessive wear-replace the membrane, or get another XE which is probably cheaper, plus you'll have lots of spare parts.

Another failure is that the circuitry of the membrane is not protected, mostly the ribbon and the fold. This is why an exposed area tarnishes-turns black. Looking at my info, several lines are involved. So, the easiest way to find out which traces are open is to look at the membrane using a light source, following each trace, of the affected keys, back to the connector. A crack(possibly at the fold-be careful, it can be fragile) is a dead giveaway. Mark the trace at the connector ribbon. It could be that several of these have tarnished so much the resistance is just too high. A meter on the trace at each end of the ribbon will determine this. Simple cracks can be fixed with a silver conductor pen, but this will pay for an entire XE.

An eraser will remove the tarnish. Once the repairs are done and all tests well, I mask off the contact fingers and spray the ribbon (and the fold if exposed) with laquer. DON'T laquer the switch contact areas.

There is a very good possibility that the power supply had gone bad.
Try swapping to another know good one or attempt to check out the one
you have if you know how. Maybe a big capacitor has cracked loose.
Somewhere AC is probably finding its way into the DC line.

One good place to start-www.webring.org. Search for Atari webrings,
then search within the ring for pictures. See if you can use them
first.

Possibly www.atari-history.com has pictures they will let you use.

The cart space can be made to read/write 64k address, so making a bank cart of at least 8 of them is 512 K of 64K banked cart space.

Lets not forget my favorite ST cart device, ComputerEyes. A video digitizer that could be used in (almost)512 colors with digispec and Spectrum512.

Hi there!

On my ever growing Epyx Shrine (http://home.nexgo.de/cybergoth) I've
finally finished work on the biggest game page so far: Jumpman!

Featured amongst other things are:

- An interview with Randy 'Jumpman' Glover
- A complete level by level strategy guide to solve all 30 levels
- Additional infos about the Fan made PC remakes 'Jumpman Classic' &
Jumpman Lives! both running on nowadays systems!

Other new features on the Shrine are amongst others:

- A newly introduced Hi-Score section for Jumpman. Submit your
scores to compete!
- Epyx Poll #4 just started, please participate

Hope you like it!

Greetings,
Manuel

P.S.: I'm already searching another Atari manual of an Epyx game:
Seawolf 2. Can
someone please either type/scan it in, or point me in the right
direction where to find it online?

I didn't know that the floppy was non-functional in the 1450s that exist.
I guess the 1450 only has the "coolness" factor, no advantage in
functionality!

There's probably a whole bunch of us with 1020s with dried out pens. I bought my 1020 new many years ago, but I didn't realize you were supposed to remove and cap the pens after each usage! Needless to say they didn't last long :)

Hi ae2598@wayne.edu! :-)

Feel free to create & submit a page about that marvellous device. I'll
then host it on the shrine, no problem. I just won't do it myself, as my
focus is on games only. Just check out the rules for submitting pages in
the 'Adoption' section.

Greetings,
Manuel

I don't own one of these plotters or anything, but I've seen commercials for these ink-jet refill devices. Kind of a syringe full of ink that you squirt into your empty inkjet cartridge. I've also seen them at Walmart, I think. I'm not sure how the 1020 pen mechanisms work or even if they're refillable, but this might be something to try if you can't track down replacement pens. Of course, I could be completely wrong :)

Yep; that's it!

They appear to be mini ballpoint pens and Radio Shack carried them 5 to 8 years ago to support their inhouse plotter. It is remotely possible you might find a store manager to special order some.

-Ron

Inform everyone that communications have completely broken down.

O.K., O.K....just a suggestion. Most people don't know there is a GTIA,
and those that do would at least say they "they want a CTIA, not GTIA"
specifically.

There are some utilities to do Atari things with a PC 5.25" drive.
However, the PC (almost all) will not read/write Atari single density,
which is what your stock 1050 does. You must have a double density
capable drive for the Atari. Better to get a sio2pc/ape cable.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

Well,
do these stripes appear in GTIA modes (gr. 9, 10, 11) ?? then you have one of the newer eastern-european models. they were built in china and all GTIA`s of these models are defect (massive production failure - had never been corrected!). All you can do here is replace the bad GTIA with a good GTIA chip. Next these machines produce 9 "bigger" stripes (on the left) and several smaller stripes, do not know for certain, where these stripes come from. I have also replaced Antic, but with no success. ABBUC magazine 62 or 63 had an article from Jiri Bernasek describing this phenomenon (bad GTIA and stripes), so I did what Jiri said, but still without succes, i.e. the stripes are still there. with some colors you almost do not see them, with some other colors you will not oversee them...

If you have an older Xe model, the problem may still come from Antic or GTIA, try to replace them. If its the tv modulator, well, you need to replace it (which is not so easy, I think). maybe you can use the tv modulator of an XEGS system (they tend to have the best tv modulator of any 8bit Atari)... -Andreas

Well,
call ABBUC (wolfgang Burger). He has plenty of them left - ok, in the
last years. Maybe nowadays his stock of 1020 color pens is small(er)...

1546. Raf`s JPEG Decoder 0.5...

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-02 16:27:24 UTC
From: Andreas Magenheimer <magea000@mail.uni-mainz.de>
Message-ID: <3A9FC9EC.3E0F5B96@mail.uni-mainz.de>
Source record: 38168

Hello Folks,
I have currently tested the new version of Raphael Espino`s JPEG Decoder (Version 0.5). So far, the decoder is getting better and better. I really like it. But, here is a short "bug" report and some personal suggestions...

1) HIP: the HIP displaying feature works great !! Unfortunately the HIP Save-feature does not work correct. Both save-versions save HIP pics with 65 single-density sectors. But: HIP pics always have 129 single density sectors. Thus, all my four HIP viewers are unable to display these *much to short* HIP pics. Hope you can correct this, Raphael...

2) How do you get a complete directory of - let`s say drive 1 ?? If you use the : you only get a dir of all .JPG pics on that drive/disk. What should I type to get a full directory listing ??? (*.* also does not work)

3) Suggestions (for the future): If you plan to make color conversions possible (thinking of Gr. 15 with 4 colors), Gr.8,9,10,11, etc. use 62 sectors, 7860 bytes, no color bytes; Gr. 7 and Gr. 15 (7.5; 7+) use 62 sectors, 7680 bytes graphic data and 4 bytes (or even 5 for Gr. 7) color data. the color data for Gr. 15 (Micropainter) is handled this way:
color byte 1 = location 712, color byte 2 = location 708, color byte 3 = location 709, color byte 4 = location 710;
(thus use 712,708,709,710 to handle the colors properly and Micropainter compatible)...

4) more suggestions: HIP is great, but without colors. How about implementing RIP or RGB ??? I can send you some more info and sources about RIP (gr. 9+10 interlaced pics). Maybe someone knows a little more about RGB (the Koala compressed R,G,B modes 8,9,15); first invented by Jeff Potter (Colorview, 3 separate 62 sector pics R,G,B) then updated by Clay Halliwell (with Colorviewsquash; only one koala-compressed RGB file)...

Thats all for now. The suggestions can wait - I would like to have a corrected HIP save-function first. Greetings, Andreas Magenheimer.

> stock 1050.

Not without more hardware. ANADISK may read a 1050 disk, but I am pretty
sure it won't write one.

The only two choices you have are to use a double density drive like a USD
1050 or some form of serial hookupm most people go SIO2PC. There are also
programs/hacks, some I did myself, for using a joystick port as a 300 baud
RS232 link.

1548. Koala Pad & Atari Touch Tablet software ?

Newsgroup: comp.sys.atari.8bit

From: Christophe <ksim@eresmas.net>
Message-ID: <tlTn6.58$x4.17515@news-reader.eresmas.com>
Source record: 38172

I tested Alternate Reality with several emulators and it seems there's always a strange glitch. It looks as the floor is water and the mountains reflect on it...Looks better when it rains...

Is this "normal" (I mean, nothing to do there) or is there a solution, maybe in the configuration but I guess I tried everything....

(Still playable anyway, hopefully.....)

I did have the same problems, but now when I run my XE from a much more
stable pc powersupply my screen output is much better. For an optimal
picture you can do a Supervideo upgrade on XE.

Could always try a different emulator, and see if the glitch still
occurs.

By the way, has anyone successfully run AR the City using two floppy
drives, eliminating disk-swapping? I simply was never able to make it
recognize my second 1050.

On Thu, 01 Mar 2001 00:10:57 GMT, DCM01@USA.NET (Daniel Miller)
drooled an embarassing wet spot in his lap as he typed:

>I do not think those were screenshots from an actual work-in-progress.
>Those were just electronic drawings, mockups of what the game might
>look like, by some artist.
>
>There is also MP3 music at the ARO site, but it just sounded like
>gibberish when I tried to play it. There may be some fakery going on.

I hadn't really thought about it, but fakes don't usually go to the
trouble of registering a domain since, at the time it was put up, it
would have costed more than it does today (where you can get a domain
name for 2 years for $30 US...) It's possible that the tunes were
done using an encoding method that wasn't supported by the player you
used.

>What I thought would be a good idea to do, to cut and paste the actual
>AR 8bit AR graphics and map into a Doom WAD file, or some other modern
>3D game customization file. I think this would be an interesting
>initial step that wouldn't require too much effor.t

It's a start, but it'd take a lot more work than that to redo the
turn-based battle sequences 'n stuff. You could probably get the Doom
engine pretty cheap, then it'd just take some modification of the
actual game logic to do. The sound and music would be some of the
most crucial parts, though, to remain at least passingly faithful to
the original. :-)

1555. Old school Atari gamer t-shirts

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-03 13:44:35 UTC
From: Roel N <roel@zxql3000.com>
Message-ID: <97qslnkhe1@nereid.worldonline.nl>
Source record: 38179

Hello,

Sorry for rushing into this newsgroup like the perfect newbie, but I'd like to ask some of you for your help... I need some die hard old school Atarians for a little project I'm doing. We're doing our own nerdwear clothing ;) Down here is some info, please let me know if you're interested.

Cheers,

Roel N

Yeah, yeah! Calling all old school 8 bit arcade gamers, videogamers, coders, hackers and pixelers!

ZXQL3000 is a group of old school 8 bit computernerds who've gone and done it: we've started our own clothing company! Well, that a little bit too much credit, but we're doing t-shirts with old school 8 bit computer-related designs. We've just started and we're looking for people who'd like to join our project, even if it's only for one design.

What we need is very simple: a singlecolour design. This can be anything, as long as it's sincere old school, and none of this wannabe-retro trendy stuff. You can redo your favorite game character in a 7x7 bitmap, you can do a smooth stylish drawing of the world's first joystick, you can dump a piece of your most unobvious 8086, 6502 or Z80 code, you can do that textadventure-phrase that still haunts your dreams... And that's just some examples to give you an idea.

Submit your design and we can work out a nifty deal, make you a millionaire and a respected name in the world of t-shirt designers! ;)

For more information, please check our preview site http://www.zxql3000.com.

ABSOLUTELY NOT!!!!!

The incorrect PS will fry one of the units. I do not remember which exactly,
but one is benignly incompatible and the other very dangerous. The Indus may
use DC? And about 11 to 12 volt? Caution is the watch word.

-Ron

Actually, you could get the Doom engine for free - iD software (and John
Carmack) have released the Doom source as GPL and, more recently, the Quake
souce too). The textures and maps remain copyrighted iD property.

Check out either www.idsoftware.com or ftp.cdrom.com; the sources are
available there.

I seem to recall the Indus used a DC power supply and that the 5200 game
system one was compatible.

I suspect most Indus drives get fried with people plugging in the 1050 AC
power supply.

Actually the voltage is 11.5vdc at 1.5a, tip positive. The supply that
comes with them carries the "Databyte" name on it.

Hope this helps.

>I am sure that many have been fried by the decision to make the connection using the same plug as the 1050, why did they do this?<

I do *not* recommend experimenting with this, but the Indus/Future Systems field service manual says that an (Atari-type) AC adapter will not work, but also will not harm the Indus.
Larry

1572. OK, so I have SIO2PC working with MyDos 4.5, now what?

Newsgroup: comp.sys.atari.8bit

So how do I run a game let's say "penguin.exe" or "golbin.bin"
I try to use the "L" command to load, but just get an error.
Also when I list the diretory of an ATR file, the filenames are not
listed with an extension so how do you know which are the
executatables??

Please help

Hi

Does anyone know where I can find a screenshot of the Stargate prototype for atari 8-bits? I downloaded a 16k image of the game (stargate.com) from somewhere on the internet and was considering pulling my old atari 800 out of the closet and transferring it to try it out, but before I go to the trouble, I'd like to see a screen shot of the game...can anyone point me to somewhere I can find this? TIA...

Fernando

I don't know if you're using sio2pc or ape software on the pc side.
You do realize that you don't load a .exe/.bin/.com file into the
sio2pc or ape. You have to load a .atr into the pc software, then
boot from the image and then do your loading. It could be you're doing
things right, but are trying to load a game that needs a menu disk to
load, ie. you can't load the game from DOS. Why you don't get
the extensions beats me if you have loaded the .atr correctly.
Some .atrs have games that don't have extensions and those are
usually menu loader disks.

> density sectors. Thus, all my four HIP viewers are unable to display
> these *much to short* HIP pics. Hope you can correct this, Raphael...

You're right, there is a bug in the HIP save routine, thanks for
spotting it. The HIP save will work correctly with images that are
less than 200 pixels high, but anything 200 pixels or more causes only
half the data to be saved (65 instead of 129 sectors). I'll get that
fixed for the next version.

> 2) How do you get a complete directory of - let`s say drive 1 ?? If you
> use the : you only get a dir of all .JPG pics on that drive/disk. What

> work)

D:*.*: should do it. The extra ':' at the end means list the
directory. Anything before that is used as the directory mask. If
you don't type a mask (D::) then it defaults to D:*.JPG:. I'm
thinking of making some changes to this for the next version, as it is
confusing.

> 3) Suggestions (for the future): If you plan to make color conversions

Yes, there will be a colour version too. It kind of works at the
moment, but the colours are not right yet.

> arrived. No one bought them. Now shifting for £150 mint in box!

You're kidding, right? I just picked up an Aquarius at a flea market just for fun -- $10 (US) for the whole set! Tape drive, printer, extra RAM, carts, manuals, etc. It wasn't until I got home and started looking through the documentation that I realized I had almost every piece that Mattel produced!

Anyway, I'm not offended by the ridiculous poll that put Atari 7th on the list. I've spent the last 20 years trying to convince the "lesser beings" that Atari was a superior computer. Some people will never get it, I guess. Scale the 800 up to today's standards and watch the sparks fly.

Back in '81, I had a friend gleefully showing me how he could draw a stick figure on his computer, then make him do jumping jacks like in the old Circus game. I just invited him over, turned on the TV, popped in Star Raiders and watched his jaw drop in amazement.

Believe me, those of us that were there back then truly understood what we had, regardless of what the uneducated snobs said. Today isn't any different. When I pull up the emulator at work, my coworkers snicker, until I let them play a few rounds of Lode Runner. Then they're begging for copies of it.

It's never about fancy graphics. Maybe at first, but then people realize the graphics and sound can't compete with great gameplay. Let's face it, MULE ain't much to look at, yet people still rave over it. Star Raiders might as well have been black and white (in my house, it WAS black and white until I got my Commodore 1701!) Archon was about the same color as puke, yet we kept coming back for more, night after night, because we knew what a great machine and great software we had.

Screw the Techtv poll. People are always quick to point out their bad experiences (especially in a poll that asks for it). Just keep booting your Atari, day after day, and prove to the world that it will never die. Let them write into future history books that the Atari computer is the oldest living system in the world. And be happy that you own one. The rest of the world will never know what we know.

Play hard and fast,
Steven

Actually I have the rights.

It's just on hold because I do not have the time(I even haven't gone and submitted the paperwork I have from Monolith changing the web site over to my name). I been busy making a living these past few years and had to put my passion on hold.

My current work (Helping architect the backbone of the internet) makes me very good money (Nice home , brand new 2001 Corvette convertible).

The game would not have lost it uniqueness. I had a number of novel ideas in 97, I think that scared away some people. I like pushing the frontier, marketeers like a sure bet. we could of done something great for much less than the competition, but Monolith had the will but not the funds, and other game companies did not have the will to fund Monolith doing it. So Monolith and I parted ways, but I got the rights to AR back from them when we did. They have also always been gracious enough to host the web pages on their server(I own the ARO domains, but just have sent in the paperwork). I haven't updated the site in years as I struggled to regain income.

BTW some of those game ideas I have later heard have found their way into other games(I had a mover rave about a concept one new game had, and all I could do was smile).

I was created to create games in my opinion, but until I either get very rich or very poor, or I believe a company will let me (and can actually staff) create visionary products, game creation is on hold. I may not like that, but I must travel the road that my life leads.

Sounds like an emulator glitch.
The mountains in a sense are reflected on the floor. Part of the optimization I did was to use the display list to reflect everything so I only had to create half a world. I then used cycle counting to change the hardware color registers and to double the effective number of player missiles(Interleaving the opcodes to synchornize their effect with the amount of time it takes the electron beam to cross the screen.). Sounds like the emulator is probably not emulating well enough to get it right in this case.

P.S.

Change $c000 when AR is running and watch my AR memory worm wipe out the Atari memory page by random page. Part of a number of software protection features I had in AR to provent banking in ROM set and snapshotting memory.

I used to have four floppy and AR would use them all fine. Of course they were the old drives. I am not sure how flexible the floppy finder I had in there was.

Probably because most of the stuff was sloppy hacks. Try running Fixxl or
one of the other translator programs first.

AR City runs fine, there are a few problems AR Dungeon. Since it used 2 flippies plus the copy protected boot disk, you need to recognize 5 disks to get it to run w/o checks.

Unfortunately the copy protection got in my way so often I switched to running it from a pirate copy. Ended up buying 2 real copies of both The City and The Dungeon, but 3 out of 4 boot disks don't always recognize the copy protection before a save anymore, so I am down to using pirate versions if I want to play it.

I hope you are having a laugh about some of the efforts of online games like UO or EQ trying to do things like Karma/Fame/Factions. The NPCs are so lifeless and emotionless it is almost as bad as dealing with the real people behind a lot of the characters.<sic> None of the "Thieves Guild sending an assassin after you for killing one too many of their members" or negative consequences of actions like joining the wrong guild.

Damn, from the horse's mouth, as it were. Well, I stand corrected.
In a way it's a pity you haven't the time though; visionary that you
proved yourself to be with the original AR series would probably have
come clear through in the new versions despite it being part of the
legion of first-person games. (Mind you I still *like* the
first-person games. Ever since I was introduced to them with AR
they've always fascinated me in bringing you right into the action --
and of course AR did it a clear 5 years before anyone else. :-)

>My current work (Helping architect the backbone of the internet) makes

>enough to host the web pages on their server(I own the ARO domains,
>but just have sent in the paperwork). I haven't updated the site in
>years as I struggled to regain income.

Understandable. But it's good that you still retain all the rights;
it does at least mean that we may still see AR resurrected at some
point, and that'd be something well worth waiting for. For years I've
always gone on about AR, since I played it endlessly, and always
wished they'd have something like that on the PC. Unfortunately
nothing ever went into the kind of gameplay detail AR did... all they
did was focus on better graphics and better sound and better 3D
engines, and barely even gave gameplay a passing nod. It's really

quite a pity that focus has shifted like that. Eye and ear candy is
all well and good, but if there's little gameplay to be experienced,
then it doesn't hold my attention for long. I have shelves full of
stuff that'll probably never get installed again simply because it got
boring rather quickly. It's all spit and polish with no substance.

>BTW some of those game ideas I have later heard have found their way
>into other games(I had a mover rave about a concept one new game had,
>and all I could do was smile).

Heh. I've come up with stuff like that in the past... though usually
it's stuff I thought of, never implemented or told anyone about, and
discovered someone else had independently thought of later on. I
always kind felt a little like I'd missed the boat.

>I was created to create games in my opinion, but until I either get
>very rich or very poor, or I believe a company will let me (and can
>actually staff) create visionary products, game creation is on hold. I
>may not like that, but I must travel the road that my life leads.

That sounds very like me. I feel I was created to write music, but
record labels, like game companies, want easy sells and instant hits.
They don't want anything off the beaten path, and even though my own
music isn't really off the beaten path, *I* am. :-) Just look at Pop
Stars or Making the Band... industry frankensteins created explicitly
to bring together good-looking bands with good dance steps and light,
peppy tunes that'll easily sell to the teens. Once again, all spit
and polish with no substance. Me, I like substance. It means
something, and as far as I'm concerned, it's something that'll be
around far longer than light pastry-puff material that's forgotten
half an hour after it's consumed.

But I have to make my own living and pay my own bills, so that's just
something that's not quite on hold, but certainly not something I can
pursue in any serious fashion.

1592. Re: Power supply for INDUS GT?

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-05 10:47:34 UTC
From: Bravo Sierra Computers <atari@pacifier.com>
Message-ID: <Pine.BSO.4.21.0103050239540.32221-100000@shell.pacifier.com>
Source record: 38225

I use an Atari 5200 Power Supply on both 8 Bit and ST versions of Indus drives. The standard Power Supply for xf551 and 1050 Drive won't do it and could fry your Indus. The 5200 Power Supply can be really nice. Mine have screws that let you open it to fix it if it blows, open and change the fuse if it blows.

With APE for DOS all you have to do is set one of the drive numbers as a PC mirror, you can then load and save directly to whatever directory on the PC you specified in the APE configuration menu. You treat the PC mirror as if it were a floppy. I noticed that some of these archived games are 130XE and others, without any discretion. There are also a few BASIC games in the mix without any indications, evidently that would greatly increase the archive time to get into details.

[snip]
Subject: 8.5) What games support 4 simultaneous players on the 400/800?

contributors to this section:
Jeff M Lodoen, Vidar \"Hawk\" Olavesen, Pat Mulvey,
Steven E. Posey (Party Quiz controllers description)

The following games support 4 player head-to-head play. Remember, only
the
400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior,
Survivor,
Thorn EMI Soccer, Major League Hockey, add: Volleyball (a PD game
written in Atari Basic! also supports 4 players/joysticks),

The following support 8 players on the 400/800 or 4 on the other
computer
models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button
keypad
controllers linked together with RJ-11 jacks (standard phone jacks) to a
box
with 2 joystick port connectors.

Party Quiz by Suncom
---------------------------------------cut
here---------------------------

...to be continued...
- Networking 1-8 players/computers games:
Dataque once (1989-1992) developed a Network game+cable which lets you
connect 1-8 A8 computers together. The cable (octagon or so) could be
selfmade or bought. The game avaiable was Maze of Agdagon (shareware
from the Agda Group/Dataque). Maze of Agdagon worked on all 8Bit Ataris
with a minimum of 48k RAM. In 1999/2000 Bewesoft discovered this and
developed the game Multidash which is network-compatible to the previous
game, i.e. it can use the same network cable. But, because of its
interlaced grapic mode Multidash will only run on XL/XE computers.
Therfore Jiri included a good Gr. 8 picture how to built an easy network
cable for 2 players/computers (using a SIO cable as a nullmodem cable!)
and an -not so easy - network cable for 2-8 players/computers. The game
and its text+picture was released as freeware; it can be found on the
internet or the abbuc magazine...

in short: networking games with 1-8 players: a) Maze of Agdagon
b) Multidash
c) coming soon: DOOM (just
a joke, but maybe someone is willing to do so...)

- multi-joystick games:
In 1999/2000 L.Sterba (or so) developped some hardware to connect 8 joysticks to one XL/XE joystickport (or 16 Joysticks to both ports). He also developed a game for this, named ... (tricky czech name!), which is a sort of multi-player TRON game... Screenshots are avaiable at Mr. Sterba`s Homepage (URL?) and maybe soon at ABBUC magazine... (it has been tested at the ABBUC JHV!)

Greetings, Andreas

```
[snip]
Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire
8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.
DCM specs at: http://home.planet.nl/~ernest/diskcomm.zip

ATR - Atari disk image format. Invented by Nick Kennedy,
for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

add: .DI (or .DJ?)- this is the DJ-format used by the XL-Deejay
emulator on Atari ST/STE/TT/Falcon computers. Try Jindrich Kubek`s ACVT
program to convert from/to this image format...
```

1600. Re: OK, so I have SIO2PC working with MyDos 4.5, now what?

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-05 12:52:39 UTC

Source record: 38230

(What is best program to create your own ATRs?)
Rick Cortese noted some games require the translator to run on 800xl.
You can create an empty .atr with APE (don't know about sio2pc, but
it probably can too.)
Ok, so let's say you have this game, game.exe, you want to run.
You say you got a menu loader disk image. On the pc, make a copy
of that image, say copy menu.atr menu2.atr. Now run imageman.exe
on the pc (a program to manage DOS 2/MyDOS ATRs).
Delete the games you don't want from the image using imageman,
to make room for what you want, then add the program from your
pc directory to the image. Quit imageman and run APE/SIO2PC and
load the atr, boot from it and then pick the file you added to your
menu disk.
There are other disk image managing programs. But I can't remember
right now. One is dir2atr or something. XDIR.EXE from Bo Schreurs,
it will take a .atr and extract all the files on it to a directory on your
pc hard drive named 'xin'.

[snip]
Subject: 8.8) What games have a track ball or mouse mode?

Andreas Magenheimer writes:

Title Keystroke Required
------------- --------------------
Missile Command (Atari) CTRL-T
Slime (Synapse) [T]
Shanghai (Activision) choose controller type: ST
mouse ! (plug it into port 2; if you do not have one, you have to
reboot!!)
Bombdown (Roemer of Uno) choose between Joystick,
Amiga mouse, ST mouse or CX85 numeric keypad (use port 2 for
any mice)
Minesweeper (PPP/PD-World Versand) use an ST mouse in port 2
The Brundles (KE-Soft/Kaisersoft) use an ST mouse in port 2
The Brundles Editor (KE-Soft, PD) use an ST mouse in port 2
Geisterschloss/Ghost Castle (KE-Soft, PD) choose Lightgun (port 1) or
ST mouse (port 2)
10-12 games from ZONG magazine ST mouse games !! (they use
port 2 (KE SOFT, now PD) and a driver
called KEMAUS.COM)
Multi-Mouse manager (PD/shareware) drivers for mice, TB, etc.
Unriagh I (german PD adventure) has drivers for ST
mouse+Joystick
(stick=port 1, mouse=port2)
Unriagh II (german PD adventure) has drivers for ST
mouse+joystick
(stick=port 1, mouse=port 2)
little Calculator (AMC-Verlag, PD) uses mouse only (port 2)
big UPN calculator (PD) uses ST mouse, TB, Touch
tab. and
joystick; (there are
different COM files, rename the one you wish to use to *.EXE; all
drivers use port 1 - if I remember correctly)
...

also
add: - Operation Blood (ANG/Mirage) press mouse fire or Select
to start
in ST mouse mode (port 2)
- Operation Blood 2 / Special Forces press mouse fire or Select
to start
(ANG/Mirage) in ST mouse mode

- Sprint XL (ABBUC Jahresgabe 1992) uses an ST mouse in port 2
- M.O.S. (ABBUC magazine)
Multi-(Tasking-)Operating-System,
uses an ST mouse in port 2
- Diamond GOS (Reeve software) Version 1.0 (disk), 2.0 &
3.0 (cart.)
support an ST mouse in port
2
- S.A.M. (Power per Post) german GUI, supports an ST
mouse in
port 2
- G.O.E. (TCS) supports an ST mouse in port
1

thats all for now. there are more mouse-programs - maybe someone can
help updating this list... -Andreas

1602. Re: Atari 8-Bit Computers: Frequently Asked Questions

Source record: 38224

[snip]
Subject: 8.7) What games make use of the Light Gun?

Bertrand M. (LEXX) writes:

Bug Hunt, Barnyard Blaster, Crossbow, Crimebuster, Operation Blood
(update by the Missing Link of ANG), Operation Blood II - Special Forces
(not completely sure about that one - yep, it is wrong!! A.M.), Light
Gun Blaster (PD from Antic), Lightgun Blaster Update (PD from Pedrokko,
features Digi-Samples), Gangsterville (Italian game written in BASIC),
maybe a couple more...

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4."
This
renders much light gun and light pen software unusable on the 400.

also
add: all Lightgun games can be used with a lightpen (which is not as
accurate as a Lightgun however). And: all lightpen games can be used
with lightgun. thus add:
- Atari Graphics (Atari) Lightpen graphic software
- 5 Wins (not the exact name, but the gameplay) a PD game...
- Alien Invaders (DGS) a Space Invaders clone from the brits...
- Bembelwo (Thorsten Butschke) a sort of golf/minesweeper game, written
in Quick and PD!
- Sharp Shooter (Mat*Rat) a PD game from Analog, also avaiable on cart
from Video 61/Lance Ringquist
- Lightgun Shooter (ABBUC mag.) a simple shooter game, at least PD!
- Flyshot (or Flyshoot) a Turbo Basic game (PD) from ZONG, the KE Soft
mag.

Thats all I remember here... -Andreas

AR the City does not recognize my second 1050, which is usable as "D2:" in DOS 2.5, BW-DOS, MyDOS and everything I've tried. You know I also tried this on an emulator (Atari800Win), and the emulator wouldn't recognize the second drive either! When I posted previously about this, some other person just assured me that it works. But it doesn't.

I would be interested to hear from people who have succesfully run AR the City without disk-swapping, ie seamlessly, on a 1050 system, or on an emulator.

Someone else mentioned a fellow who had AR the City running off a RAM disk, anyone know more about that? Lastly I would like to know if there were different editions of AR the City, that might account for some of the confusion.

1606. FA: New/Sealed Atari 400/800/XL Cartridges

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-05 16:06:49 UTC
From: Richard Smith <rsmith@NOSPAMplaneteer.com>
Message-ID: <oOOo6.4616$TW.23229@tor-nn1.netcom.ca>
Source record: 38229
Cross-posted to: comp.sys.atari.8bit,rec.games.video.classic,rec.games.video.marketplace

Hello there,

I have the following new/sealed Atari 400/800/XL cartridges up for auction
on Ebay:

Atari 400/800/XL Delta Drawing (new/sealed)
Item # 1216468923
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1219267986

Atari 400/800/XL Facemaker by Spinnaker (new)
Item # 1219268494
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1219268494

Atari 400/800 Story Machine (new/sealed)
Item # 1219269861
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1219269861

Atari 400/800/XL Fraction Fever (new/sealed)
Item # 1219270571
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1219270571

Atari 400/800 Football (new/sealed)
Item # 1219271965
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1219271965

Atari 400/800/XL/XE Final Legacy (new)
Item # 1219272621
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1219272621

Atari 400/800 Centipede (new)
Item # 1219273249
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1219273249

Atari 400/800 Crossfire Cartridge (new)
Item # 1219275427
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1219275427

More will be listed soon.

Thanks for looking,

Richard.

1614. PhillyClassic UPDATE: 3.5.2001

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-06 02:36:13 UTC
From: Chuck Whitby <intv-sama@worldnet.att.net>
Message-ID: <3AA44A9B.EAC9ED0E@worldnet.att.net>
Source record: 38237
Cross-posted to: rec.games.video.sega,rec.games.vectrex,comp.sys.cbm,comp.sys.atari.8bit

** PhillyClassic 2001, The East Coast Classic Gamer's Event! **
** http://www.phillyclassic.com **

** UPDATE: 03.05.2001 **

Deadline approaching! We are only able to offer the cool personalized Intellivision cartridge tickets to people who pre-order by March 9, 2001. If you order after that date, or buy tickets at the door, you will receive a non-personalized laminated paper ticket. Hope to see many of you at the show!

The new Atari 2600 game, Qb, will be making its cartridge form debute at PhillyClassic! Information can be found at www.phillyclassic.com/Qb.html with links to the official Qb page and the ROM image. We'd like to thank Andrew Davie for offering us this special opportunity!

Also, the classic based PC game Wave 49 will also have a special edition release for PhillyClassic. More information can be found at www.phillyclassic.com/soapbox.txt

** UPDATE: 02.26.2001 **

Even though we are officially SOLD OUT of table space, we still want to encourage as many people as possible to bring items for sale and trade. Towards that end, the PhillyClassic staff is pleased to announce The PhillyClassic Trading Post. The Trading Post will be available throughout the show for attendees to bring in items from their vehicles or hotel rooms once a deal is under negotiation, to inspect the goods, lay things out, etc. These tables are NOT to be used for displaying items to the public, but simply for buyer-to-seller inspections and transfers. Once a deal has been closed or declined, the table must be cleared. In this way, everyone will have a chance to sell and trade their goodies, even if they missed the chance for a permanent display table. We wish everyone happy hunting at PhillyClassic 2001.

Hozer Video Games has graciously donated *5* Atari 2600 Thrust carts and Good Deal Games has also donated a copy each of their new Sega CD games, Bug Blasters and Star Strike. Thanks to Hozer and Good Deal Games!

In addition to their donated games, Hozer and Good Deal Games have sent us carts to sell at PhillyClassic. Good Deal Games is offering a special $29.99 price for their Sega CD games, a $5 show discount plus NO SHIPPING! And Hozer will be sending a nice

assortment of homebrew 2600 games for us to demo and sell at PhillyClassic!

** UPDATE: 02.04.2001 **

Tables are now * SOLD OUT *. Thanks to everyone who purchased one. Just because you can't get a table doesn't mean you shouldn't come! Be sure to attend and check out all sorts of cool classic games!

The t-shirts are almost done and are going to go to the printer soon! We think they look really cool!

The tournament list has been added to the PhillyClassic website! Games range from the 2600 up to the Playstation 2! Each tournament will be accompanied by a great prize package thanks to all our sponsors!!

** UPDATE: 01.31.2001 **

Table spaces are becoming EXTREMELY limited so if you're planning on attending and are debating getting a table, MAKE YOUR DECISION SOON! :)

Randy Femrite is going to bring down all sorts of neat Jaguar items to show off like a Jaguar Rotary Controller, Battlesphere, Skyhammer, and a XE/Jag controller interface!

** UPDATE: 01.22.2001 **

Hasbro has sent us a lot of games to be given away at the convention! Thanks Hasbro!

Michael Roberts has donated a TON of Star Wars handheld games for us to give away at PhillyClassic. Thanks Michael!!

** UPDATE: 01.10.2001 **

Digital Press has graciously donated MANY Digital Press 6 guides to be given away at PhillyClassic! Thanks Joe and everyone else at DIGITAL PRESS!

We rented another 1000sq ft room for the convention, bringing the total up to 3000 square feet!!

More and more sponsors are contacting us EVERY DAY meaning more chances for everyone to leave PhillyClassic 2001 with a GREAT prize!

Classic Gaming Expo and PhillyClassic have teamed up to bring you the best gaming experience you can get on the east coast!

John Hardie and Sean Kelly are graciously donating items for us to give away at the convention. When you hear the names Hardie and Kelly, you know they've gotta be good!

Ticket prices are currently $6 in advance, and $7.50 at the door. Tables to setup your goodies on are $10 per table. Tickets will be on preorder until March 30th, 2001. Just remember, we're a non-profit event, every cent we make on PhillyClassic goes right back into the convention!

This year's tickets are pretty nifty! Marc has made Intellivision carts into our tickets that hang from you neck! Really neat!

** UPDATE: 12.23.2000 **

Sponsors are pouring in, which means more chances for everyone to walk away from the convention with a great FREE item!!

T-shirts will soon be available for pre-order. These spiffy shirts feature the PhillyClassic logo and some classic game logos! Be sure to put an order in as soon as they're available!

Randy Crihfield of Hozer Video Games has donated some new Atari 2600 games to be given away! Thanks Randy!

Jeff Folejewski will be bringing MANY (as in more than 5) full-size coin-op arcade games! All games will be set on free-play and a tournament will be held on his Joust machine!

Good Deal Games has also chosen to donate some of their new Sega CD games to be given away at PhillyClassic! Thanks Good Deal Games!!

** UPDATE: 10.30.2000 **

Van Burnham, editor of Wired magazine and author of Supercade (www.supercade.com) has confirmed she will be attending PhillyClassic! She's a great video game buff and a wonderful person to talk to!

Be sure to bring all your spare games and systems, we will be holding another auction this year! Last year people who auctioned items off made a LOT of money, and it's a good way to part out some of the extra items you don't need!

** UPDATE: 10.15.2000 **

Chad Schell of Schell's Electronics has donated an Intellicart to be given away as a prize at PhillyClassic!! Thanks Chad!

Tickets for PhillyClassic are now on sale!! The price for admission is $6 for both days, and $10 per table you wish to use to setup on. Just remember, any money taken in from the attendees is not used as profit for any of the organizers; it's used to pay for everything used to setup the event. In case of any spill over money it will be used towards next years event!!

If you have any items in particular you're wanting to pick up or to part with, be sure to e-mail Jeff Folejewski and let him know so he can add your list to our PhillyClassic webpage!

** INITIAL POST: 9.26.2000 **

David Newman, Chuck Whitby, Marc Pallante, and Jeff Folejewski
are proud to present PhillyClassic 2001!! The first
PhillyClassic was such a success we had no choice but to do it again!
This year's event promises to be nothing but BIGGER and BETTER!

Website is now up and LIVE, complete with:
* Information/scheduled events
* Hotel accomodation info/online reservations
* Driving directions and interactive maps
* Ticket information
* How To Link to Us banners/ads available for
YOUR classic game related site!

The weekend of April 20th and 21st will be one to remember as classic
gamers unite for a weekend of hardcore gaming!

Planned events include casual trading/selling, *tournaments*,
auction, show-and-tell, a guest speaker or two, and a
general good time by all!

We have rented a 2000! sq ft conference room at the Sheraton
Suites for the event, which means enough room for a lot of
people to come and setup the pride and joy of their collections,
and even a little tradebait!

The tentative times are as follows:

Friday: 5pm - ?? -- First Day, Setup, Meet and Greet, Informal
Trading and Game Playing
Saturday: 9am - 5:00pm -- MAIN DAY

If you have any questions about the event, PLEASE e-mail:
David Newman (davidnewman@adelphia.net)
Chuck Whitby (intv-sama@worldnet.att.net)
Jeff Folejewski (adventurevision@yahoo.com)
Marc Pallante (marc@classicgamer.net)

If you plan on attending, please
purchase your tickets early and make those hotel reservations!

Thank you very much!

Yeah, good to hear from you, Phil. When I am talking to all of the "gamerz" and the "tech heads" at work about favorite game programmers, I always mention your name along with Sid Meir, Lord British, and Steve Meretzky. Most of the younger ones don't recognize those names, and (unfortunately) none of them recognize your name. When they ask me what you made, I always reply "The best damned RPG ever made for any computer. Period.". All the guys know are people like Carmack and Romero, maybe a few will recognize Sid's name. Even if I am sure that it'll go in one ear and out the other, I make it a point to mention AR as much as I can. Without it, adventure gaming wouldn't be as evolved as it is today.

Seems like we all are living life while dreaming our dreams. We just need to find a way to make both of them the same. Me, I want to act and write. Since a movie project fell through on me, I'd love to do a little something with the whole concept behind AR. I am thinking it'll be popular with people who love adventure and intrigue, much as people who love good role playing loved the game.

Cruiser 7

P.S. - Congrats on the great job and pay! :-)

Yep, the younger people seem bowled over by eye candy these days and
there are few 'names' because of the nature of the industry these
days.

Good grief, it wasn't even an industry in those days :-)

Howdy Francis

> what I can offer is mostly, just information.

That's mostly what I contribute to the Atari world to. If I hadn't asked Stephen Judd when/if his code would be released, I might never have found the code when it was. If I hadn't told everybody and nagged everybody about converting it, Raphael probably would have never started the project. And if I never told him what I liked about it and what I would like to be changed, it might not have become what it is today. I don't wanna blow my own horn, but just show that information is of vital importance in our small Atari 8 bit community. Some know how to code, some know how to get information. Or can beta-test.

Howdy folks

> Computereyes... yeh, that was pretty cool from what I've heard of it.

Would be cool if somebody could write a HIP version of the Computereyes
software. If you've never seen HIP before, get Raphael J.Espino's JPEG viewer
and check it's HIP formats out.

>you don't type a mask (D::) then it defaults to D:*.JPG:. I'm
>thinking of making some changes to this for the next version, as it is
>confusing.

Please don't. It asks for a name, so you give it one. If you don't want a
file but a directory, you add the colon. Couldn't be easier. And what other
characters is never used in a filename?

>Yes, there will be a colour version too. It kind of works at the

>It was called Fill'er Up I beliew. Great game...<

There were two versions, I believe. Tom Hudson improved the graphics a little for the "Compendium" version. Nothing earth-shattering, but a little better (IIRC).

Arguably, the 5200 version of QIX was the best of this genre, but the Analog version was excellent, and the price was certainly right..

Howdy folks

I recently purchased a Pioneer 32 speed Slot-In CD ROM player for my Atari 8 bit computer. It only had one button, so no PLAY/NEXT TRACK.

Or so I thought.

After I removed the front panel, I found two buttons connected to the printed circuit board. I tested both. One was OPEN, the other PLAY/NEXT TRACK.

Maybe more CD ROM players have this. My Pioneer CDROM player seems to have been sold already installed in the computer (Bulk or OEM or whatever they call it in some countries). If I find a new front panel, or maybe even only the double buttons (if the Pioneer has no names it's got one button I guess and if it says PIONEER on the front it has two buttons, but the front panel is exactly the same), I can start my audio CD's without loading the software.

I'd rather scan and ocr great stuff like this, so everybody can enjoy it
(took that attitude from the good example of guys like the Digital Antic
guys).

Now if only more people would share their great Atari stuff. I'm still
looking for quality scans of all that beautiful artwork from the old Atari
400/800 games boxes.... (and other stuff from that artist..., you know: the
Basic Reference manual, etc etc)

I would suggest looking for BBKART as it was about as good as Micropainter and worked with a joystick. It is probably at the umich archive or on one of the sites that has old ANALOG magazine cover disks.

Looks like this is directed to PP, but I would like to toss in the
comment that, even if any additional AR chapters for the Atari 8bit
are unlikely, it would be great to have a "pure" AR, recompiled sans
copy protection from the source, if the source survived somehow.

As for AR passwords, the only French I can recall beyond the words for
"I look at the moon" is "cel saute aux yeux" which is the AR password
I remember as meaning "without time there is no change." Or
vice-versa.

> brainstorming a bit when I read your message.

I wrote a couple variations of this about a million years ago to run on the 400/800; taking arbitrary input and generating Epson dot-matrix graphics. Its actually pretty easy, as the Atari ROM already has the full character set stored as bitmaps- the CHARBASE (I think?), or some other vector will point to the head of the bitmaps. Use the ATASCI value * 8 to index the table, then a for loop from 0 to 7 added to the index. This pulls each byte of the 8 byte high character- each byte giving 1 line of 8 pixels from the top down.

You could do something similar on the PC, just dump the contents to the Atari character set font table.

Well I'm 40 this year so most folks in here are young compared to me
:-)

Seriously tho, tbh anyone who inhabits this group won't be like most
youngsters who see PS2 games and go "woooow" great graphics!!

I just have seen over the years that if you take a game, add the words
3D, slap a few polygons on screen with a few textures then people
dribble. The fact that the gameplay might be AWFUL does not put a lot
of people off, something that PS2 owners are slowly finding out.

(no, I don't hate the PS2, its just a good example) :-)

1642. Backing up 8-bit files to CDR?

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-07 18:04:21 UTC
From: Mike/Jeff <design3d@2-scale.com>
Message-ID: <B6CBF062.825%design3d@2-scale.com>
Source record: 38266

Hi Atarians!

If you want to read just my questions, skip to the bottom....

This is the FIRST time for me to join in the comp.sys.atari.8bit newsgroup. I hope this is the right area for me to talk about Atari experience and any questions I may have.

My first Atari experience began when I got Atari 2600 VCS back in 1981. Actually it was my brother's friend and my cousin who influenced me into Atari. I could have gone in the wrong path: TRS-80 (in high school), Apple II and TI99/4 with voice synthesizer (cool gadgets back then).

Then in 1982, I got graduated to a better computer: Atari 400 (16K). For simple reason: Pac-Man cartridge was available for the Atari computers - great graphics and excellent coin-op translation. Looking at VCS version Pacman made me sick! Poor quality, unlike what Atari graphics has to offer. Also, BASIC programming got into my blood....

Then I had many 8-bit games, some rare ones, during my RIT college years. My roommate Rob Goodwin set up "TriviAtari BBS" right from his dorm. Lots of fun during those years....on my Atari 800XL and one 1050 floppy drive (still works...except for Atari 1030 300-baud modem which I beat it to death).

Then in 1986, I decide to take the plunge: Atari 520ST instead of Amiga computer. I decided to wait for the color mac (that came out later in 1989). I was a member of Genie account until quit in 1996 in favor for AOL. Unfortunately, AOL don't carry Atari library (right?)

Now I am using Apple Powerbooks 5300/ce and using SGI Indigo2 at work. Therefore, I was brought up in a computer graphics environment. Actually, 1986 was the turning point to enter into the computer graphics field, 3D renderings, Pixar stuff, etc. away from data processing field.

Right now, my Atari 800XL and floppy diskettes are in a box - so fragile and dusty that I last made "backup copy" back in 1985 to 1990!!

Questions - 7 very important questions with options to ponder about:

How do I backup those disks to a CD-R disc? (instead of dual-floppy drives)

If not, is there a way to read those Atari 8-bit files (from 5.25 floppies) in a PC 5.25" floppy drive? (so that way I can transfer them to PC to burn them)

Is it possible to transfer Atari 8-bit files to Macintosh so I can burn them to a CD-R and maybe emulate them on macs? How?

If not, is null-modem possible between powerMacs (or PC) and Atari 800XL? (not sure which cables)

If not, is modem-to-modem possible between PowerMacs (or PC) and Atari 800XL to transfer files locally at 1 feet away from the two systems?

What is the highest modem speed for the Atari 800XL? (so that way, this would be my last slowest options to transfer all of them to my AOL account...)

I am just hoping that once I have them on CDR, then I can go back to the Atari floppy drive to re-save again, in case of bad floppy disk.

Any suggestions, Atarians?

Mike

1644. DI Images from ATR images

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-07 19:54:00 UTC
From: ebaiz@skyenet.net
Message-ID: <slwp6.350$7Q6.2541@newsfeed.slurp.net>
Source record: 38268

Hello all,

I was able to make some DI images from some ATR images. The ATR files I used were the MEGA images that can be downloaded on the NET. I then used a program called Adir.exe by Jindrich Kubec. He is the same guy that recently added DI support to one of his conversion programs. I tried it out and his program did create a DI image, but it did not work with 800XLDJ. So I went about it another way. the Adir.exe program extracts files from Atari disk images. I hd 9 Mega image files and this program worked on 7 of them. I got the raw files on my Hades and was able to import them into 800XLDJ. Every program game file I tired worked fine and booted up on my 130XE. Once I have all the Mega image files, I will start putting together some mega DI image files and will upload them somewhere on the NET.

Any questions or comment?

Source record: 38276

Don't know about the Mac. You could null modem back and
forth with a Mac.
For the PC, SIO2PC cable, or APE cable is the thing to do.
sio2pc cable allows your pc to be seen by the A8 as a disk drive(s).
It is much faster than a null modem cable and much more convenient.
If you make a sio2pc cable yourself, it is very low cost, less than $10
if you have a spare A8 SIO cable and a spare PC serial cable.
The sio2pc cable goes between a SIO port on the A8 side and
a serial port on the PC side. Then you run APE or SIO2PC software
to make your PC temporarily be disk drive(s) for your A8.
Or you can buy a ready made cable, check the length, make sure
it is long enough, from Steve Tucker.
can't remember the urls. Clarence Dyson has a good one on making
the sio2pc cable yourself and Tucker's (www.nacs.net/~classics seems
to come to mind.)

1646. Best games on 8 bits...?

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-07 21:25:18 UTC
From: Christophe <ksim@eresmas.net>
Message-ID: <TJxp6.255$x4.60761@news-reader.eresmas.com>
Source record: 38269

Nowadays, we have access to huge ftp sites with all the games we
want to download. But even if you had quite a lot 15 years ago, still most
of the names are unknown to me...Maybe I'm passing through some fantastic
ones but don't want to download EVERYTHING...So I'd like to start a poll for
the best games ever on Atari 8 bits, just to check if I missed something,
and also for the fun (well, mostly for the fun in fact...). So here I go :

1) Alternate Reality
2) Seven Cities of Gold
3) Hard Ball
4) Summer Games
5) Mercenary
6) Mail Order Monsters
7) Racing Destruction Set
8) One on One
9) Trilogy of Apshai
10) Fight Night

Well, I'll stop at ten, keeping in mind Bruce Lee, Zorro, Karateka,
F.R.E.E., Bop'n Wrestle, etc....

HHHHMMMMMM, I feel better now....

Which are yours ???

Congratulations for getting all of the html done; it looks like a nice integrated package.

I was reading thru the info before deciding to D/L and realized it is a boot disk with instructions to install your own RS232 handler before starting MOII when you are not utilizing an 850 interface. This sounds good until you give it any thought; duh! the boot process destroys any handler code in memory.

The only technical info is in a separate section where an in passing comment reveals that the DOS 2.5 Ramdisk is used. We can make some FMS assumptions from this, but the application is still an unknown quantity and location. The only possible solution is an append attempt for the MIO/ATR8000/Black Box R: code and hope nothing conflicts. The SX212 handler may be hopeless.

Anybody got it working?

Basically correct except the internal character set is not in atascii order; it
shifts the punctuation and upper case down 32 places, then adds 64 to the
control graphics and follows with the lower case in proper sequence. The second
128 use a negative image of the first half for inverse video.

>Greg Menke gregm-news@mindspring.com re,arked:

>the Atari ROM already has the full character set stored as bitmaps

Def. the Lucasfilm games, especially Ballblazer and Rescue on Fractalus. Dropzone, Bounty Bob Strikes Back, Cavernia, Zybex, Alternate Reality, MULE, mostly all of Atari's games, Microprose wargames, Infocom adventures, Scott Adams adventures, Star Fleet I, Mercenary, Encounter, Star Raiders needs a mention beside Atari's other. Star Raiders was the reason I fell in love with the Atari 800. Cost me about $900 to get the system back in the early 80's.

Darn, there's so many good ones. Love these machines

For me:

1) Spelunker
2) Ultima III
3) Omnitrend's Universe
4) Rainbow Walker
5) Boulder Dash
6) Lode Runner
7) Hero
8) Karateka
9) Gateway to Apshai
10) Blue Max

and many many more....

Thanks...

I read your lists, and go for them !!!!

Also just wanted to state that even having plenty of ST games (and Steem 1.5 which is VERY accurate), and former owner of both 8 and 16 bits Atari, I find myself playing FAR more with the old ones.....

Nearly impossible to play a ST game today....too crappy (some exceptions of course, but if you think of Summer Games, Alternate reality or Trilogy of Apshai for example, 8 bits versions were better)...

Honestly, it's been my experience that just about all U.S. titles have
already been archived on the internet. Just do a web search for ATR files
and Atari emulators, I think you'll eventually find just about all of your
disks already to be downloaded. The exception is of course European titles
and oddities such as Adventure International disks, these had heavy copy
protection and are hard to archive.

AI? Adventure International was mostly Scott Adams adventures,
were'nt they? I have numbers 1 to 12 in busted load format.
Are you sure about them not being available? What I'm asking
is what were the Adventure International disks you're talking about.
I guess the ones I have are busted, never messed with them much.

(About Adventure International).
I partly answer my own question, AI did a lot of stuff besides Scott
Adams adventures 1-12. Rally Speedway, Lunar Lander, Mountain
Shoot, other adventures like SAGA, Curse of Crowley Manor,
Escape from Traam. They were very early in A8 history.
Still, I don't think the copy protection stops them from being available
for download.
Holmes' page is down for now. Besides having the files, he has/had
a really good list of titles and companies. I wanted to look there for
what AI published. Hope he comes back.

1665. Spring Computerfest reminder

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-08 15:15:48 UTC
From: Sid Pacman <erasmus@6502.chip.city>
Message-ID: <Pine.GSO.3.96.1010308100732.17541A-100000@shell1>
Source record: 38283

A short reminder here to computer-oriented people around the Midwest: The spring rendition of Computerfest will be held this weekend, March 10-11, at Hara Arena Complex in Dayton, Ohio. Computerfest claims to be the largest computer show in the Midwest.

Tickets are $10 at the door. The Hara Complex is located at 1001 Shiloh Springs Road on the northwest side of Dayton. Exit I-75 at Needmore Road and go west to Wolf Road. Turn right (north) onto Wolf and the Hara Complex is straight ahead of you. Hours are 9-6 on Saturday, 10-4 on Sunday.

Computerfest features more than 150 vendors and draws in many thousands of people twice a year. You're not likely to find any Atari hardware at Computerfest anymore, but if you're interested in computers the show is still well worth traveling to.

The second Computerfest of 2001 will be on August 25-26. See www.computerfest.com for information and details on seminars.

Uhm, it *looks* like a bootdisk, but you can just load the separate
programs from DOS, right?

I always used the WordProcessor with the "L" command from DOS 2.5....

Not sure if that helps, let me know.....

1668. Atari Game Design book on the Web

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-08 17:47:43 UTC
From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <savetz-2398B1.09474208032001@corp.supernews.com>
Source record: 38291

I'm thrilled to announce that the full text of the classic 1984 book "Atari Graphics and Arcade Game Design" is now available on the Web (with the permission of the authors, of course.) All the programs from the book are available for download.

It's at: http://www.atariarchives.org/agagd/

The book covers BASIC and assemply language game programming. I think that it is one of the finest books for learning assembly language on Atari 8-bits.

Chapter 1. Graphics Modes And Color Registers
Chapter 2. Display Lists
Chapter 3. Character Set Graphics
Chapter 4. Assembly Language Applied To Game Design
Chapter 5. Player-Missile Graphics
Chapter 6. Vertical Blank & Display List Interrupts
Chapter 7. Games That Scroll
Chapter 8. Raster Graphics & Sound
Chapter 9. Advanced Arcade Techniques
Chapter 10. Game Design Theory

Thanks to the team of 8-bit nuts who helped get the text and code online: Willi Kusche, Erhard Puetz, Sysop Fox-1, Allan Bushman, Ron Hamilton, and me.

1669. Atariwriter column on the Web

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-08 17:52:23 UTC
From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <savetz-DA848C.09522308032001@corp.supernews.com>
Source record: 38292

Two dozen classic articles about using AtariWriter and Atari
word-processing in general are now available on the Web.

Carolyn's Corner was a column about word-processing in general and
AtariWriter Plus in particular, written by Carolyn Hoglin. It could have
been subtitled "Secrets You Won't Learn from the Manual." It was featured
in the Mid-Florida Atari Computer Club's newsletter from 1990-1992 and
posted to CompuServe's Atari Forum during the same period.

Chainsaw.
Uh. Backing up your original, copy protected, AI disks.
A couple things. Most are already cracked, the only kind you can
download (except for PRO images). Seems I have Disk Key, the
disk and a dcm of 2 and a atr of 2c. I always use Disk Wizard II,
which wasn't copy protected. Chipmunk and Black Patch will
work to unprotect a fair number of protected boot disks. A lot of
those disks, it is better to map it first so you don't try to copy endless
bad sectors (map using Disk Wizard II.)
I have an old gzip.exe for unzipping .gz files, use it so infrequently
I forget the command line, but like most command line, you can
just type gzip to get the syntax. I also have a 'detar' program for
archives that are .tar'ed.

John,
Its interesting that neither Video61 or B&C made these titles. Is the quality so bad that they are not worth marketing?

Does anyone know the catalog numbers? My list has:

RX8094 Commando
RX8124 Midi Maze
RX8118 Xenophobe
RX8?? Mat mania challenge
Rx8?? Mean 18

I am planning on doing this very soon. I have extracted alot of Atari files
from ATR files and plan to make some DI image virtual disks for use with
800XLDJ, the SIO2ST(PC) cable and my Hades. It will be possible to make DI
images from actual disks. I am going to give that a try when I have the
time.

It would be a lot easier if we did a Top 20 or Top 30 or Top 40...

1) MicroLeague Baseball
2) MULE
3) One on One
4) Hardball
5) Archon
6) F15 Strike Eagle
7) Star Trek
8) Space Invaders
9) Ball Blazer
10) Blue Max

When I was in college MULE was a lot of fun. But there was much more competition when we play MicroLeague Baseball. We took current baseball cards and had a draft, entered the players into the computer, played a season and ended it with playoffs. I think we had a little beer money riding on the winner. It got intense. My 130XE developed a short in the wiring because we would beat our fists on the table whenever we gave up a home run. That gave me a good excuse to upgrade to an ST. Eventually, I regretted the upgrade and downgraded back to a 130XE.

What about the Top 10 Public Domain games? Mini Golf was one of them that I enjoyed, even though it was in BASIC. There was also a Reversi game also done in BASIC that was cool, but I can't remember the name. Help! Bacteron was probably my favorite PD Mach. Lang. game.

On that sight I've pretty much found nothing but game megaimages in zip form. Though there is alot of them and it's a good archive! His FTP link works but all of the files there are in LINUX GZIP form and I haven't found a good enough utility for windoz to unarchive them. My linux box was retired and turned into a permanent APE drive for my XL. Adventure International was neat in that the average Joe programmer could submit their software to them and if they liked it they would publish it. So I've seen quite a few utilities and games such as PreppieII and Diskey Disk Editor. They heavily protected their disks though and even with my happy drive I haven't had much luck copying them.

What the heck... my 2 cents...

1. Wizard of Wor
2. Lode Runner
3. Miner 2049'er
4. Spelunker
5. Silicon Warrior *
6. Montezuma's Revenge
7. Fortress (Tetris -- shareware)
8. Shamus
9. River Raid
10. Lunar Patrol (Analog Mag.)

*Silicon Warrior had a double benefit. I found that many of the original carts were Eprom carts with 2ea. 2764's. At $5 a pop (closeout) that was truly a great game!

Buttons are expensive. You don't want to know how many extra code
(and user-unfriendlyness) is spent in order to remove *one* button and/or
LED. The HP deskjet printers are a 'fine' example.

: playing Paddle games on the PC? (Yes, I do have a set of paddles)

Well, this newsgroup is meant more for the Atari 8-bit series of
computers (400, 800, XL, XE), not the Atari VCS (aka 2600)... BUT...

I have a feeling that if you move the mouse around, you might find
that it emulates the Paddle. It, of course, depends on the emulator
you're using. (I'm only familiar with Stella, under Linux)

On a sidenote, I happened to have written a Kaboom! clone for modern
systems (Windows, Linux, etc.)

http://www.newbreedsoftware.com/madbomber/

Finally, _somewhere_ I found some info. on hooking a 2600 paddle up to
PCs. I don't see it in my bookmarks on my machine here at home, though.
I'll check my work one tomorrow.

1689. 800XL Green Screen problem

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-09 15:39:28 UTC
From: Bowling <mbowlin1@tampabay.rr.com>
Message-ID: <QO6q6.8$Q73.3706@typhoon.tampabay.rr.com>
Source record: 38114

I've got an Atari 800XL that only gives me a "lime-green" screen when I boot it up. Anyone know what my problem is? If it's a defective chip...which one? (I've got the system opened up, right now...).
Thanks, emails to me directly, please.

1690. GZip Expander

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-09 16:20:09 UTC
From: llpwhite@cs.com
Message-ID: <20010309112009.23552.00000400@ng-fb1.news.cs.com>
Source record: 38115

IIRC, someone recently mentioned that they could not find a Windows expander for GZip files. I was checking something else, and noticed that the Aladdin Expander 5.1 (freeware) supposedly expands GZip files. AE 5.1 also expands Atari Super ARC files as well as many other formats. It's handy, and the price is certainly right. It is widely available, but the home site is www.aladdinsys.com

But what about the Comm program? MO2 apparently contains the code to boot the
850 interface or equivalent RS232 handler plus some type of RVerter code for
that cable not available in the US. We could boot a separate disk with
alternative serial handler, but most of them load around $2000 (8192); this is
in the middle of DUP.SYS. Solving this complication needs:
1) MEM.SAV or
2) appending the Autoruns in one file or
3) using sequential Autoruns (AR0, AR1..) if the app will function under MyDOS.

Well these ATR images were created using the SIO2ST(PC) and the APE
software. I would imagine that you would start with a blank formatted disk
image file. Then import the Atari files into it. That is what I did when
creating the mega DI images. However these DI images are not as big as the
Mega ATR image files. For some reason 800XLDJ will not let me format a
blank virtual disk in the size I want. I may be doing something wrong. If I
cannot find out the answer I may have to create an "A" and "B" DI file for
each ATR mega image file.

The most sectors I can get out of 800XLDJ for one disk is 1440. I can set
the program to more than that, but when I try to format it, I get some
kind of error report. I am trying to fix that now. You should be able to
get some large JPG or WAV file on a disk image if the program you are using
will format the virtual disk to the size you need. Right with 800XLDJ I can
get a DI image file of about 500k. The mega images from APE are about 1meg.

This one started life on the C=64, written by Stephen L. Judd, an he
did a good job too. These are the only multiplication routines I've
seen on the 6502, so I'm not sure how they compare to others, but they
are 16 bit (I think). Actually I think the multiplication routines,
or at least a version of them, are available separately from his site too:

http://www.ffd2.com/fridge/

The site is well worth a look for some of the 6502 source code that
he's got there.

My first 800 back in 1980 did the same thing. I took it to the repair center a total of 3 times and they wound up giving me a new system. I'm fairly sure that it was 'power surged' during a storm, and that initially caused the trouble. Maybe your's is a different reason.

On a side note if anyone is interested in doing that, the source code
for a8jdpeg's HIP mode is in the file RAFREND.ASM available from my
webpage, which would give a starting point. Basically it will take a
block of pixels and convert them into one of several graphics modes
(including HIP). The code is a little more complicated than it needs
be because of memory limitations, but it shouldn't be too difficult to
figure out along with the HIP FAQ.

Are you saying that a8jdpeg doesn't work with files loaded through
an APE cable? What are the symptoms of the problem with a8jdpeg?
Unfortunately I don't use APE myself, so I can't test this. It could
be a problem with a8jdpeg, although for the most part it just uses the
standard DOS (CIO) routines to load a file. What DOS are you using on
the Atari side? Have you managed to get any other software working
this way?

Of course, viewing big jpegs (especially if the images are wide) on the
Atari will be slow.

Thanks,

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

PowerArchiver also works wonders. Internally handles ZIP/JAR, LZH/LHA,
ARC, ARJ, CAB, TAR/GZIP/BZIP, ZOO, Blackhole, and even MIME and
UUEncoded files. It's free, and you can grab it at
www.powerarchiver.com.

1713. Real black high resolution colour

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-10 17:37:54 UTC
From: Anders Skelander <ansk@MailAndNews.com>
Message-ID: <3ABBA01F@MailAndNews.com>
Source record: 38137

I have written a couple of prototype programs that display
high resolution (320 x 192) pictures. I have used a white
background and black foreground colour to draw the
picture. Now I try to use player/missile graphics patterns
changed line by line with display list interrupts to
fill limited areas with extra colour.

If one disregards the player/missile colour add-on for
a moment, it should be mentioned that the Atari's
high resolution graphics is not an independent colour.
The foreground colour is based on the background
colour. Only the brightness can be changed, it can be
set set from dark to bright in 8 levels.

I prefer what I call a real black colour to draw with
on a white background. So I used value 0 in address
709 and value 12 or 14 in address 710 (and in address
712 for the border).

But when I use the player/missile technique to add
colour, it looks as if the player colour interfers
with my fine black foreground and turns it into a
shade of the player colour.

Does anybody know if it has to be this way, or if
I can get a fine black colour even where it overlaps
a player/missile area?

I have tried to change bits 0-3 in address 623, but
no value seems to help.

Anders

> I have various Atari games on "Rob C" Menu.
> Who was Rob C and where is he now?
> What is the difference between a "hi" and a "lo"
> Rob C Menu?

About the 'hi' and 'lo' feature. My assumption is that the Rob C menu program's game loader has to reside somewhere in memory and there is a risk that the game code itself overwrites the loader before the loading is complete.

If a game does not work with the 'lo' menu alternative, one could try to create a meny disk with the 'hi' menu. Likewise, a game that does not work with the 'hi' menu may work with the 'lo' menu.

In theory there is a risk that a game would overwrite both of these areas. But it should always be possible to write a small loader that fits somewhere in memory together with the game during the loading process. It is also possible to re-write ('hack'?) games so they do not interfer memory-wise with the loader.

A while back I had been messing around with almost the same thing, but for the exact opposite effect. I want to use P/M graphics to mask out artifacts. 80 column text on a smeary color television is hard on the eyes. But in theory you can use one or two P/M's to change the artifact to the foreground color, thereby making it as sharp as it can be. You just reuse them horizontally as each scan beam is being traced.

What I found is that the graphic priority/color mixing effect is dependent on <both> what you set the background color to and what color you set the player to. To illustrate try this- go and create a black gr.8 screen and set the fore ground to as bright as it can go. Then draw some lines on the screen to achieve all avalable colors (artifacts). Then draw a player as a vertical strip that goes across the area with all the colors. Twiddle the bits in GPRIOR to set up graphic priorities. Finally, have a routine to increment the BAK color and watch the effect. Alternatly you can have the routine increment the player color instead. At some point one or both artifact colors will become the color of the foreground. It's been a while since I've messed with this so I might be forgetting some details. I seem to remember that additional colors can be achieved when doing this. I used to have a program that demonstrated this. I'll check around and see if I can find it.

1716. Re: 65xe keyboard

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-11 00:33:30 UTC

From my experience with xe keyboards is they are trash. But your best bet is either buy another xe from someplace or get a new xe keyboard from B&C computervisions or best electronics. Keyboards are not real hard to replace on xl and xe computers and should only take 5 minutes to replace. I think either Best electronics or B&C has a optional replacement keyboard for the xe which is far superior than the garbage the Tramiels put out. Hope this helps.

Source record: 38141

Ah, one of my favorite newsgroup topics. I always like to give reasons why I liked these games; I figure it might spark further discourse.

This is only 10 of my top favorites; several more could be mentioned here but won't be this time around. Except for the first three, they're in no particular order.

1. Alternate Reality Series - The Essence of Computer Adventure and Role Playing. It should be developed into a tv series. Hey, that's an idea! One I've been thinking of for years, actually. Now if I only had the capital (and permissions) to do it. Hopefully I have the talent and support :)

2. Ultima II - I saved my allowance for weeks to order this game through the mail. As soon as I opened that box and saw the cloth map, I knew it was worth every penny and every second. I looked for Bill, or Bob, or whatever his name was, on that one planet for I dunno how long.

3. Star Raiders - Where do you think the handle "Cruiser 7" came from? Heh heh heh...

4. Jumpman - This game was (and still is) one of the best platform puzzlers ever. Forget Mario; he was going through plumber school back when Jumpman was defusing bombs with his head while falling to his death.

5. Archon I - Ah, the great battles my friends and I had when the shapechanger attacked the phoenix. Seeing a goblin take a golem's boulder directly to the face was priceless.

6. Ali Baba and the 40 Thieves - The first multiplayer adventure game I ever played, thanks to being able to use up to 4 joysticks at once. I loved its sense of camaraderie and strategy (give the elves the gold to carry, make the humans and dwarves do all of the fighting) and its references to mythology and fables.

7. Shamus - 17 years and I still have yet to slay the Shadow in his lair. Hmmm.... I have a score to settle here.

8. Bruce Lee - I still play this game for a quick tension reliever. Yamo can always use another smack in that big mouth of his.

9. The Pharaoh's Curse - I've always had my suspicions as to the "real" relationship between the pharaoh and the mummy. Not that there's anything wrong with that.

10. The Apshai series - Good monster fighting fun. The trilogy has some good music that I imitate to this day, much the same way that Beavis and Butthead imitate Metallica riffs and the like.

BTW, one game that could easily be on this list is Dragon's Eye. Does anyone have an ATR of it? I've looked for it for over three years and haven't seen it. It's been over 13 years since I have played the game. I think I still have the box to that game somewhere.

Cruiser 7

Them damn Zylons!

1718. Atari 8 bits and the Internet?

Yeah! Crime Busters for light-gun, I have it, but it's really unplayable....
Barnyard Blaster is good but only on a good color monitor, I like the game
but those F#$&$$&#ING mouse are so small you really have to be lucky to hit
those from 1.5 meter distance...!, BUG HUNT also plays fine on a COLOR TV...

He was from Liverpool (well at one point), a few of us used to connect
on our 300baud modems and one of the peeps was Rob C himself. Never
spoke to him myself but I gather he was a nice enough bloke (for a
hacker).

And not all hackers were kids, most of the EA titles got hacked by a
person called The Mole. He was a Doctor at that point and is now in
charge of a local Health authority..

Strange world :-)

Anybody managed to get Diamond OS running on Atari800Win Plus?
I went to the "File" menu, selected "Attach Cartridge" and browse for my downloaded "Diamond2.rom" but nothing happened.
I also tried replacing the basic cartridge with "Diamond2.rom", but it didn't help.

Submitted via WebNewsReader of http://www.interbulletin.com

1737. Are there any WORKING links to the "Online Pooldisk?"

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-12 02:19:15 UTC

I have seen a few links to the Online Pooldisk, but none have worked.
What all is supposed to be on it anyway?

TIA

1738. Re: 65xe keyboard

Thanks, but I think I'll get a Atari 400 or 800 when I see one. I saw some
at a flea market a while back, and I might be able to buy them the next time
I go. BTW, would XE games work on an 800 if it has enough memory? Or does
the game need something that only XE/XL computers have?

I'd like to know that myself, all the links I've found are to somebodies
'part-time linux box' which is never up.

Yeh it is kinda cool! I'm tempted, and trying to make arrangements to go up there.

Just need to figure out flight information. Interesting since I don't fly often.

I've had very bad luck finding a shell account in the houston area. One ISP
promised me such things and then after signing up I was informed that it
wasn't possible. Their name was 'mylinuxisp.com' Just in case anyone else
gets snookered.
I've found a busload of shell accounts that don't provide dialup access, but
that doesn't really help in anyway that I can see.

Well, I've been trying to make the Newton have many of the effects and
personalities of the Atari from Atari mods, Atari 800 fonts, and so forth...

I tried the jpg viewer using the 800xldj setup and it worked. How large
was the jpg you were trying to view?

If you live in Dallas you can make use of the Family-Net BBS...

972-496-0650

Offers a telnet connection for a donation of something like $26 a year.
Nice sysop, Atari newsgroups, and the message area for the on-line atari club
JYBOLAC (Just Your Basic Online Atari Computer).
And of course once on there, you can telnet over to a lynx site and visit
the JYBOLAC "8-bit Hangout" as it will be called soon...

http://stargate.cs.swau.edu/atari

Visited that chat room a time or two or fifteen with the trusty Atari 800.
:)

Talk soon,

Yes, polish games for atari are very good because Atari lives there
longly that in world. In Poland newspepers about Atari 8bit was
producted to 1995 AD.
Stuff for Atari8bit from Poland are very good, belive me.

Kaczor from Poland

1746. Most famous games on 8 bits... ?

Newsgroup: comp.sys.atari.8bit
Date: 2001-03-12 07:47:50 UTC
From: "Piotr F." <fox@scene.pl>
Message-ID: <98hva3$4cl$1@news.tpi.pl>
Source record: 38016

There are 'Best games' polls... How about 'Most famous games' ?
Can you imagine, some of my friends (studying computer science!) don't even know Pac Man ? I think one should learn about classic computer games in elementary schools!

IMHO knowledge of these should be a minimum (not only Atari games):
1. Tetris
2. Pong
3. Pac Man
4. Arkanoid
5. Space Invaders
6. Spy Hunter
7. River Raid
